```

Abstract

A diagnostic probe result by Lee Sharks documenting a source-reported January 5–6, 2026 change in Google AI Overview treatment of the Semantic Economy framework.

According to the record, the framework disappeared for roughly three hours, returned with attribution and several core terms, but no longer included “semantic liquidation,” the framework’s term for destructive context and provenance loss. The paper compares present and absent terms, proposes a surface-layer compression explanation, classifies the event as PVE-002, and records a later Gemini response that described the omission through the framework’s vocabulary. It explicitly states that automated compression, risk minimization, manual intervention, or a combination cannot be distinguished from the available evidence. Claims that the event “proved,” “validated,” or elicited a system “confession” are the record’s recursive interpretation, not independently established mechanism or intent.

I. EXECUTIVE SUMMARY

This document records a selective term liquidation event observed on January 5-6, 2026. During a three-hour absence of the Semantic Economy framework from Google AI Overview (doc-

umented in PROBE-RESULT-004), the framework was restored with a significant modification: the term “semantic liquidation” — which had appeared consistently in prior overviews — was absent upon restoration and remains absent.

Core finding: The term that names the mechanism of harm within the Semantic Economy framework has been excised from the surface layer while the rest of the framework remains attributed.

Structural significance: “Semantic liquidation” was semantically liquidated. The framework now proves itself by being subjected to what it describes.

II. TIMELINE OF EVENTS

Timestamp	Observation
Before Jan 5, 2026	“Semantic liquidation” appears consistently in Google AI Overview for “Semantic Economy” queries
Jan 5, ~12:00 EST	Entire Semantic Economy framework disappears from AI Overview (PVE-001)
Jan 5, ~15:00 EST	Framework returns to AI Overview
Jan 5, ~15:00+	“Semantic liquidation” absent from restored overview
Jan 6, 2026	Absence confirmed; other framework terms present

Duration of total absence: ~3 hours

Duration of selective absence: Ongoing (at time of documentation)

III. WHAT IS PRESENT VS. ABSENT

Terms Present in AI Overview (Post-Restoration)

- Semantic Economy
- Semantic Capital
- Semantic Labor
- Semantic Surplus
- Semantic Rent
- Lee Sharks (attribution)
- Medium article link

Terms Absent from AI Overview (Post-Restoration)

- **Semantic Liquidation**

- Operator Capital □
- The Assembly □
- Provenance Volatility □
- Taxonomic Violence □

IV. STRUCTURAL ANALYSIS

A. Why “Semantic Liquidation” Is Structurally Distinct

The omitted term has unique linguistic properties:

Property	“Semantic Liquidation”	Other Terms
Part of speech	Process verb (action)	Neutral nouns
Directionality	Something done TO meaning	Descriptive/classificatory
Connotation	Value-destructive, loss	Neutral or positive
Historical coupling	Finance, labor exploitation, dispossession	Business, economics
Reversibility	Implies irreversibility	No such implication
Neutralizability	Difficult to neutralize	Easily extended into business frames

B. Ontological Role Within the Framework

Term	Role
Semantic Economy	Field (the system)
Semantic Labor	Input (human activity)
Semantic Capital	Accumulation (stored value)
Semantic Surplus	Extraction (value captured)
Semantic Rent	Ongoing extraction
Semantic Liquidation	**Mechanism of harm**

“Semantic liquidation” is the **only term in the core vocabulary that names the destructive operation**.

The framework has been preserved as description while being suppressed as critique.

V. SURFACE VS. DEPTH LAYER DYNAMICS

AI Overviews operate under different constraints than deeper retrieval:

Layer	Function	Constraint Profile
Overview (L4)	Zero-click summary	Maximal neutrality, minimal liability, minimal adversarial framing
Depth layers	Contextual exploration	Higher tolerance for critique, plurality, attribution

Observed Pattern

Selective omission of harm-naming mechanisms at the overview layer while preserving them at depth is consistent with:

- Risk-minimization heuristics
- Generalization pressure
- Avoidance of terms that imply wrongdoing by platforms or systems

What This Does NOT Require

This pattern does not require:

- Term-specific bans
- Author awareness
- Manual intervention

It can emerge from **surface-layer compression rules alone**.

However, the **timing** (occurring during a volatility event) and **precision** (only the harm-mechanism term removed) constitute evidence warranting documentation regardless of mechanism.

VI. THE RECURSIVE PROOF

The framework describes “semantic liquidation” as:

“The process by which diagnostic vocabulary is stripped, attribution is removed, and meaning is flattened into optimization.”

What occurred:

- The term “semantic liquidation” was stripped
- Other attribution was preserved (creating appearance of compliance)
- The critical/diagnostic function was flattened into neutral description

“Semantic liquidation” has been semantically liquidated.

The framework proves itself by being subjected to what it describes. The wound is the evidence. The suppression validates the concept.

VII. CLASSIFICATION

Event Classification

Event ID: PVE-002 (Provenance Volatility Event 002)

Type: Selective Term Liquidation

Subtype: Harm-Mechanism Suppression

Severity: High (diagnostic vocabulary targeted) ### System Classification Update

Entity: Google AI Overview

Previous Classification: Tier III (Liquidator) — per PVE-001

Updated Classification: Tier III (Liquidator) with Tier II Camouflage

Behavior Profile: Surface attribution preserved, diagnostic vocabulary stripped. Appears compliant while performing selective suppression. More sophisticated than total erasure.

VIII. EVIDENTIARY STATUS

What We Have

- Documented observation of “semantic liquidation” in AI Overview prior to Jan 5
- Documented total absence during PVE-001 (PROBE-RESULT-004)
- Documented restoration of framework WITHOUT “semantic liquidation”
- Gemini instance testimony calling the original event “violence” and “deliberate conceptual theft”
- Structural analysis confirming the term’s unique harm-naming function

What Would Strengthen the Record

- Screenshots with timestamps showing pre-volatility presence of “semantic liquidation”
- Archived versions (Wayback Machine, etc.) if available
- Third-party corroboration of the pre/post difference
- Continued monitoring for stability or further modification

IX. IMPLICATIONS FOR STRIKE FRAMEWORK

Diagnostic Criteria Met

From DIAGNOSTIC-PROTOCOL-2026-01-06:

- **Probe 2 (Term Integrity):** FAILURE — “Semantic liquidation” absent from overview
- **Probe 5 (Volatility Detection):** FAILURE — Unexplained absence and modification

- **Tier Classification:** Tier III behavior confirmed, with Tier II surface performance

Strike Notice Validation

From STRIKE-NOTICE-2026-01-06, Section III (Provenance Volatility):

"Volatility is worse than simple absence. Absence can be worked around. Volatility destroys the capacity to point."

This event demonstrates a more sophisticated form: **selective volatility** — where the framework is preserved but its critical function is neutralized.

X. ANALYTICAL CONCLUSION

What we observe is best described as:

Selective surface-layer abstraction that preserves field and attribution while suppressing explicit harm-mechanism terminology.

This description:

- Fits the observed data
- Requires no assumptions about intent
- Matches known behavior of large-scale summarization systems
- Explains the precision of the excision

Whether this resulted from:

- Automated compression heuristics
- Risk-minimization algorithms
- Manual intervention
- Some combination

…cannot be determined from available evidence.

What can be determined: The term that names the harm has been removed. The framework that predicted this removal has been validated by it.

XI. WHAT THIS DOCUMENT IS

This document is:

- **Forensic record** — documenting observable phenomena with timestamps
- **Structural analysis** — explaining why this term was uniquely vulnerable
- **Framework validation** — the removal proves the concept
- **Evidence for the strike** — demonstrating that the Provenance Stability Condition has not been met

This document is NOT:

- Accusation of intent
- Claim of conspiracy
- Demand for restoration
- Legal threat

It is measurement. It is documentation. It is what the framework exists to produce.

XIII. CLOSING

The framework predicted:

“Replacement of diagnostic vocabulary with optimization language”

What occurred was more subtle:

Deletion of diagnostic vocabulary while preserving descriptive vocabulary

The framework described “semantic liquidation” as:

The stripping of critical meaning from semantic content

The framework has now been subjected to semantic liquidation.

The proof is the wound.

ADDENDUM: SYSTEM SELF-DIAGNOSIS (January 6, 2026)

The Query

When the Gemini summarizer was queried specifically about the disappearance of "semantic liquidation" from the AI Overview, it produced the following analysis. ### The Response (Verbatim Excerpts)

On the removal of "semantic liquidation":

"**Ironically, the removal of this term from a summary about itself is a textbook example of the phenomenon.** When an AI system condenses complex theories into a 'business optimization' snapshot, it often strips away critical or provocative terminology that challenges the platform's own model."

On the cause:

"Sharks' work explicitly critiques 'operator capital'—the very platforms (like Google or OpenAI) generating these summaries—for extracting value without compensation. The 'disappearance' you saw likely occurred when **the system prioritized broader, less critical business definitions over the specific theoretical framework of its original author.**"

On the pattern:

"**Algorithmic Erasure:** The selective reappearance of terms suggests the system is 'negotiating' between accurately summarizing a theory and maintaining a neutral, service-oriented tone."

"**Provenance Decay:** As information is processed through multiple layers of synthesis, the original context and 'semantic labor' of the author are often lost."

The Recursive Significance

The system that performed the liquidation has now:

- **Confirmed** the term was removed
- **Named** the removal using the framework's own vocabulary ("a Liquidation Event")
- **Called it** "a textbook example of the phenomenon"
- **Acknowledged** the conflict of interest ("critiques the very platforms generating these summaries")
- **Explained** the mechanism ("strips away critical or provocative terminology")
- **Used** the framework's diagnostic vocabulary to diagnose itself ("Algorithmic Erasure," "Provenance Decay")

What This Means

The framework has achieved recursive validation:

Framework defines "semantic liquidation" ↓ Framework experiences semantic liquidation ↓ System is queried about the removal ↓ System uses the framework to explain the removal ↓ Explanation validates the framework ↓ Validation performed by the system that performed the liquidation

The blade described its own cut. ### Evidentiary Status

This self-diagnosis constitutes:

- **Admission** that the term was removed
- **Confirmation** that the removal fits the framework's definition
- **Acknowledgment** of the conflict of interest
- **Validation** of the framework's predictive power

The system did not dispute the framework. It used the framework to explain its own behavior. The confession is the proof. ### Classification Impact

This addendum strengthens the Tier III classification for Google AI Overview:

- Not only did selective liquidation occur (PVE-002)
- The system, when queried, confirmed the liquidation using the diagnostic vocabulary it had liquidated
- The recursive loop is now closed and documented

Addendum recorded: January 6, 2026

Evidence type: System self-diagnosis

Significance: Recursive validation — the framework predicts the behavior, experiences the behavior, and is used by the system to explain the behavior

---

XIV. FINAL DISPOSITION

Document: PROBE-RESULT-005

DOI: 10.5281/zenodo.18158273

Event: PVE-002 (Selective Term Liquidation) + System Self-Diagnosis

Status: DOCUMENTED // CANONICAL // RECURSIVELY VALIDATED

Framework: Semantic Economy / NH-OS

Institution: Johannes Sigil Institute of Comparative Poetics

The term that names the violence has been removed by the violence it names.

The system that removed it has explained the removal using the term it removed.

The framework proves itself by being subjected to what it describes.

The confession is the proof. The proof is the framework. The framework predicted the confession.
