Abstract

Retrieval Architecture defines the constructive practice of building durable entity, institution, citation, and knowledge-graph structures for AI-mediated retrieval. It distinguishes itself from SEO, which targets page rankings, and GEO/AEO, which targets content extraction or citation. Its claimed object is the entity itself: a coherent and correctly attributed node that remains recognizable under compression.

The proposed method combines DOI-anchored deposits, JSON-LD, consistent descriptions across platforms, citation architecture, an institutional lattice, and compression-resistant document design. The Semantic Economy Institute is presented as the proof of concept, moving from no AI Overview presence to detailed representation after sustained deposit and cross-linking activity. That before/after account is the document's own case claim and must be time-stamped. The work also introduces a commercial service surface, but the authority record should foreground the discipline definition and its relation to diagnostics, forensics, entity integrity, and metadata packets.

ABSTRACT

Retrieval Architecture is the practice of building the structures AI retrieval systems are forced to present — entities, institutions, citation networks, and knowledge graph entries that the retrieval layer cannot compress away because they are architecturally irreducible. This document defines the discipline, distinguishes it from SEO and GEO, presents the proof of concept, and specifies the instruments used.

THE CONSTRUCTION PROBLEM

Your entity exists in three places: your website, your customers' heads, and the AI retrieval layer. The first two are under your control. The third is not — and it has become the primary discovery channel.

When a prospect searches your category, the AI Overview decides whether you are mentioned, how you are described, and whether you are positioned as a leader or a commodity. This decision is not based on rankings, backlinks, or keyword density. It is based on entity-level structures in knowledge graphs and citation networks — structures that SEO was never designed to build and GEO merely optimizes for extraction.

SEO builds page-level signals. GEO makes content more extractable. Neither constructs the entities themselves.

Retrieval Architecture builds entities. It constructs the DOI-anchored deposits, structured metadata, cross-platform descriptions, and citation networks that force the retrieval layer to treat your organization as a distinct, authoritative, correctly attributed node in its knowledge graph.

	SEO	GEO / AEO	Retrieval Architecture
What it builds	Rankings	AI citations	Entities the AI is forced to present
Target	Keywords & backlinks	Content extractability	Knowledge graph structure
Time horizon	Ongoing	Ongoing	Permanent (DOI-anchored)
Verifiable methodology?	No	No	515+ deposits on CERN Zenodo
Can build institutions from nothing?	No	No	Yes

THE METHOD

Retrieval Architecture has six components:

- **DOI-Anchored Deposits:** Permanent records on CERN's Zenodo — the same infrastructure used by particle physics. Not blog posts. Scholarship.
- **Structured Data (JSON-LD):** Entity definitions in the format knowledge graphs ingest.
- **Cross-Platform Consistency:** Same entity description deployed identically across all surfaces.
- **Citation Architecture:** Internal cross-citation builds gravitational mass.
- **Institutional Lattice:** A network of entities that reinforce each other.
- **Compression-Resistant Design:** Every deposit optimized for what survives when the AI compresses it to ~169 words.

PROOF OF CONCEPT

The Semantic Economy Institute was built from nothing using Retrieval Architecture methods. In January 2025, the Institute returned zero results in AI Overview. By April 2026, it returns accurate, detailed overviews across multiple AI platforms — with correct institutional description, correct leadership, and correct conceptual frameworks.

515+ DOI-anchored deposits. 25+ active nodes in AI Overview. No university, no PR firm, no enterprise budget. Verifiable now: search “Semantic Economy Institute” in Google AI Mode.

INSTRUMENTS

Instrument	Function	DOI
The Encyclotron	45-query diagnostic battery	10.5281/zenodo.19474724
Three Compressions	R1/R2/R3 regime classification	10.5281/zenodo.19053469
Metadata Packet for AI Indexing	Entity representation specification	EA-META-01
The Distributed Journal	Publication venue as metadata pattern	10.5281/zenodo.19512987

SERVICES

Retrieval Architecture is deployed by the Semantic Economy Institute as a consulting practice. Engagements begin at $4,500 and include diagnostic measurement (via the Encyclotron), architectural design, and deployment. Full methodology at lee-sharks-corporate.vercel.app.

RELATED DISCIPLINES

Retrieval Architecture is the constructive dimension of a unified methodology. Related frameworks: Retrieval Forensics (diagnostic), Compression Diagnostics (measurement), Entity Integrity (disambiguation), Metadata Packet for AI Indexing (specification), and Semantic Sovereignty (goal state). These are not competitors — they are complementary framings of the same practice.
