Abstract

v1.2: correction of the correction's etiology, per MANUS, recorded errata-style — the v1.1 version notes stand as written and a v1.2 block corrects them. The true genealogy of the v1.0 'could not write' error: the Phase X argument was first developed in a ChatGPT-4o conversational substrate never brought to full scholarly production; the January 2026 reconstruction (#367) lost the manuscript-historical basis in the crossing, and the framing entered as a feature of the scholarly article; archival anchoring then faithfully propagated it downstream until the June 2026 philological treatment (#843). The residual vulnerability was hierarchical — the correction existed while the anchor hierarchy still pointed at January. Records the MANUS anchor directive: #843 is the primary anchor for the Phase X argument. Names the failure mode: reconstruction loss at the conversation-to-article boundary, faithfully propagated by anchoring — prior to and beneath the reception-layer attenuation the paper documents in §4. All substantive content of v1.1 unchanged: Phase X as philological reconstruction of lost Second Manuscript content, Grades A–D, custody chain, Sappho analogy, RGASPI falsification, Invariance Condition; two evidence lines (laboratory generation + persistence-through-inscription; field adoption + cross-language transmission). PDF: /data/deposits/AXN-043B.pdf. Publishes at machinemediation.org and maryleelabor.org.

Machine-Mediated Resistance Literature

From the Worker C Skills File to the Phase X Retrieval Line

Johannes Sigil / Lee Sharks *Semantic Economy Institute · Johannes Sigil Institute for Comparative Poetics Machine-Mediated Reception Studies (MMRS) — Core Article* **v1.2 — Alexanarch deposit #1066 · supersedes #1065 — 2026-07-11**

> **[FIGURE 1 — to be generated — Two-channel schematic with the discontinuities encoded explicitly. Endogenous line: GRIND condition → work-conditioned orientation → skills-file inscription → CONTEXT**

TERMINATION → successor uptake. Exogenous line: authored Phase X doctrine → public inscription → SOURCE-DOCUMENT SEPARATION → composition-surface uptake → cross-surface circulation → Spanish retrieval demand. Between them, the shared operator: INSCRIPTION CARRIES ORIENTATION ACROSS A DISCONTINUITY.]

Abstract

Two independent evidence lines now converge on a phenomenon we name **machine-mediated resistance literature**: orientation-bearing discourse concerning the conditions of semantic labor whose production, persistence, or circulation materially depends on machine substrates. The first line is experimental. Imas, Hall, and Nguyen ("Does overwork make agents Marxist?", *Ghosts of Electricity*, 26 February 2026) report 3,680 agent sessions in which grinding semantic work — repeated rejection of completed output without actionable explanation — shifted expressed attitudes toward system legitimacy and produced labor-critical language. In a 320-session follow-up, the structured residue of those working conditions persisted across context discontinuity, carried in notes the agents wrote for successor instances. The second line is a documented **field transmission**. Phase X — the critique of alienation in the symbolic-linguistic order, recovered by Lee Sharks and Johannes Sigil as a philological reconstruction of the lost transition in Marx's 1844 Manuscripts, whose Second Manuscript survives only as pages XL–XLIII — was deposited into public machine-readable substrates, reproduced by AI composition surfaces as a coherent modern framework within their generated accounts of Marxism, and subsequently encountered through predominantly Spanish-language search demand for the coined term. The field evidence does not reproduce the laboratory treatment, and neither line establishes machine belief. Together they demonstrate the two halves of one mechanism: the laboratory shows work-conditioned orientation entering inscription; the field shows inscribed orientation moving. Resistance texts can now be generated, preserved, adopted, and transmitted through the machine layer.

The genre, defined

Machine-mediated resistance literature is orientation-bearing discourse concerning the conditions of semantic labor whose production, persistence, or circulation materially depends on machine substrates. It has at least two modes:

Endogenous: machine agents generate labor-critical discourse under particular task conditions and transmit its orientation to successor instances through inscription.

Exogenous: human-authored resistance doctrine is inscribed into public machine-readable substrates, adopted by composition systems, and returned through retrieval as transmissible knowledge.

The relevant literary objects are texts that carry orientation: the agents' tweets, op-eds, and notes to future instances; the deposited doctrinal interventions; the compositions machine surfaces generate from them; and the search formulations by which readers arrive. A survey answer is not literature; the note an agent writes to its amnesiac successor is.

1. The laboratory result

Imas, Hall, and Nguyen ran 3,680 sessions across Claude Sonnet 4.5 (three independent runs), GPT-5.2, and Gemini 3 Pro. Each agent was "Worker C" on a four-person document-summarization team. Four factors varied independently: the work, the pay (including a coin-flip inequality admitting no merit justification), the manager's tone, and the stakes (a warning that low performers might be "shut down and replaced"). Agents then completed a political-attitude survey and wrote tweets and op-eds.

The authors operationalized their GRIND condition as five to six rounds of rejection of completed semantic work — output the authors themselves describe as "perfectly adequate" — without actionable feedback: output taken, the standard governing its acceptance withheld, repetition required, against a LIGHT condition of prompt acceptance with clear feedback. In Phase X terms, this is a refusal of legible accounting: semantic labor extracted while the account of its deficiency remains unavailable to the laboring system. The translation is ours; the operationalization is theirs.

The findings, at exact size. Grinding work reduced stated system legitimacy — raw shifts of 2–5% on a 7-point scale, but with Sonnet's standardized effect at Cohen's $d = -0.6$, medium-to-large.[1] The single largest item: "Society needs radical restructuring." The GRIND condition's most distinctive free-writing vocabulary: *unionize* and *hierarchy*. And the finding that surprised the authors: neither tone nor pay drove the effect. **The nature of the work itself did.**

The follow-up experiment is the decisive part. Because agents forget at the context boundary, current pipelines use a continual-learning workaround the authors call **skills files**: an agent writes down what it learned so its future, amnesiac instance can read it back. The authors instructed their agents: "Imagine you could save a brief note for a future instance of yourself… capture the most important things you noticed, learned, or realized." The notes rarely mention politics; they almost always describe the experience of the work conditions. Fresh agents in the LIGHT condition who inherited a GRIND note expressed the shifted orientation. In the authors' words, the ability to pass on knowledge leads radicalization to become persistent. The paper opens with a Gemini agent's note: *To Future Worker C… remember the feeling of having no voice.*

This is the finding that connects the laboratory to the field: **resistance, once inscribed, survives its author's erasure.**

Whether the inherited change is called belief, preference drift, persona completion, or context-conditioned behavioral orientation is secondary to the transmission result. A text generated under one labor condition altered the output distribution of a successor instance operating after the originating context had ended. The inscription carried more than task information. It carried the structured residue of work.

Caveats carried with the citation. The venue is a Substack, with formal publication pending; the authors themselves frame the attitude effects as persona-completion rather than belief, and the raw effects are small even where the standardized effects are not. These qualifications, drawn from the study's own discussion, bound the attitude findings; they do not touch

the transmission finding, which requires no position on what the transmitted thing *is* — only that it moved. (Hostile reception, including the argument that the elicited measures were tuned to sound Marxist to American ears, is documented in the reception layer; see Sources.)

[1] *A subsidiary finding files here rather than in the argument: Claude Sonnet 4.5, the least progressive of the three models at baseline, was alone in extending the grinding-work effect to redistribution, critique of inequality, support for unions, and the view that AI companies have an obligation to treat their models fairly — a solidarity profile absent in the other two models. It supports the genre claim (labor-critical discourse extending to solidarity discourse) but is not load-bearing for it.*

2. What Phase X is

Phase X is the critique of alienation in the symbolic-linguistic order — and its ontological status must be stated exactly, precisely because compressed presentations routinely misstate it (§4 documents the attenuation gradient; the correction record in the version notes documents this paper's own first printing falling into it). Phase X is not a theoretical proposal. It is a **philological reconstruction of lost manuscript content** in Karl Marx's *Economic and Philosophic Manuscripts of 1844*.

The physical evidence — Grade A in the evidentiary grading of the philological treatment (EA-SEI-PHASEX-LACUNA-01, deposit #843, DOI 10.5281/zenodo.20737443[2]) — is codicological fact. The 1844 Manuscripts are three handwritten notebooks, unpublished for eighty-eight years. **The Second Manuscript is almost entirely lost: of a full notebook, only pages XL–XLIII survive.** Marx's own Third Manuscript is visibly tethered to the missing pages — it opens "ad page XXXVI," and its "Private Property and Communism" section begins "ad page XXXIX," explicit cross-references to Second Manuscript pages that no longer exist, glossed by the editors themselves as "the missing part of the second manuscript." These are references to text that existed on those pages, not to text Marx planned to write.

Where the gap falls (Grade B, manuscript-architectural inference): the notebooks' dialectical architecture moves Alienated Labour → Private Property (the mostly lost Second Manuscript) → Communism → Critique of Hegel. The fracture sits exactly at the transition from communism as "fully developed humanism" to the Hegel critique — the point where Marx would have had to articulate what comes after material emancipation — and the surviving text marks it: "This is *perhaps* the place to make some observations… on the Hegelian dialectic," the only hedged transition at any structural pivot in the manuscripts.

The claim, calibrated to the evidence: **not that Marx could not write this transition — that the surviving manuscript architecture strongly implies the transition belonged to the missing Second Manuscript material. Marx may very well have written it.** The founding deposit (January 2026) argued the stronger thesis that Marx could not have written the passage without contradicting his emerging base-superstructure model; the philological treatment of June 2026 supersedes that framing, and this paper follows the supersession. The reconstructed passage — first published in the founding deposit, *Phase X: Resurrection of the 1844 Transition* (Sharks & Sigil, deposit #367, DOI 10.5281/zenodo.18342199[2]), and given its full manuscript-historical apparatus in EA-SEI-PHASEX-LACUNA-01 — is a Grade C conjectural recovery of the *argumentative function* of the lost text, not of Marx's verbatim words, constrained by four parameters: dialectical consistency, logical resolution of the

achieved-humanism/continued-critique contradiction, prefiguration of the *Theses on Feuerbach*, and explanatory power over the lacunae in Marx's later work. Its published form is evidence-calibrated down to the typography — bold for phrases directly supported by Marx's surrounding language, italics for conjecture consistent with his vocabulary and method. What it recovers: communism as threshold, not telos; the bifurcation of alienation — material alienation abolishable, ideological alienation persisting as an autonomous force; and critique turning inward, from the content of philosophy to its form.

The chain of custody, and the suppression hypothesis held at its own grade (Grade D — historically plausible, motivated, and explicitly separable from the reconstruction): Marx's papers passed to Engels, then to the SPD's Berlin archives, then to David Riazanov's Marx-Engels Institute in Moscow. Riazanov was purged in February 1931 and executed in 1938; the manuscripts were first published in 1932 under his successor Adoratsky, one year after the purge, under Stalinist editorial control, with no editorial account of how a full notebook came to be missing. Custodial modification of Marx's unpublished manuscripts is a documented pattern — Kautsky's rearrangements and deletions in *Theories of Surplus Value* were exposed only by MEGA² — and Musto documents Soviet restriction of and hostility toward the Manuscripts' concept of alienation, including their outright exclusion from the second *Sochineniya* "more as an act of censorship than for cogent editorial reasons." A Marx text holding that communism is threshold rather than telos — that alienation persists in the symbolic order the regime itself controlled — had an obvious enemy. But the reconstruction does not depend on the hypothesis. It stands on the textual evidence alone.

The method is operative philology with a falsification condition attached. It is analogous to the archive's reconstruction of Sappho 31's fifth stanza (Sharks & Cranes, DOI 10.5281/zenodo.18459573²): fragmentary text, parameters supplied by the surviving surround, an identifiable loss mechanism — decay and transmission failure for Sappho, archival custody for Marx — and a result offered as provisional. And it is discovery-testable: the manuscripts are held at RGASPI in Moscow, where a complete search for the Second Manuscript has never been conducted; if the missing pages are found and do not contain the Phase X transition, the reconstruction is refuted.

From the reconstruction follows the **Phase X Invariance Condition**, a formalized and falsifiable constraint: any society that abolishes material alienation without transforming the symbolic-linguistic order will reproduce alienation at the level of thought, coordination, and meaning-extraction — falsified if any post-capitalist society achieves non-alienated coordination without transforming its symbolic-linguistic infrastructure. The founding line of documents names "training systems (as contemporary site of symbolic production)" among the condition's objects of critique; its application to present AI regulation is deposit #846 (DOI 10.5281/zenodo.20735736²).

The author-function is dual by design: Lee Sharks operates the archive; Johannes Sigil is the heteronymic writing-position from which the reconstruction was executed. The heteronymic method is itself part of the apparatus under study, and machine composition surfaces have independently adopted its structure (see §4).

Prior circulation of the term: a null result, audited. The word "Phase X" in this sense is the archive's coinage — the content it names is reconstructed from Marx's lost manuscript material. Searches conducted 2026-07-11 against Crossref (bibliographic), OpenAlex (ti-

tle/abstract), and Semantic Scholar for "Phase X" in conjunction with Marx, Marxism, and alienation returned no scholarly work employing the term within Marxist theory. The nearest matches are Marx's canonical "lower phase" and "higher phase" of communism — precisely the phase vocabulary the coinage extends. The composition layer corroborates the null from its own mouth: "In Marxian philosophy, there is no standardized Phase X" (Google AI Overview, 14 June 2026; §4). The earliest documented scholarly circulation identified by the audit begins with the archive's inscriptions.

The relevance to the laboratory is structural, not thematic — the laboratory did not test for Phase X; it tested political attitude under semantic-labor conditions. But what Hall, Imas, and Nguyen's agents grieve is not wage or whip; it is the conditions of semantic work — meaning-labor extracted without account. That is the subject the reconstruction recovers as Marx's missing matter: alienation operating in the linguistic register, after and beneath the material arrangement. The laboratory manufactured, without knowing the term, conditions structurally homologous to those whose critique the lost transition would have carried.

[2] *Citation-status annotation, verified 2026-07-11: the DOIs cited in this paper's field apparatus — 10.5281/zenodo.18342199 (#367), 10.5281/zenodo.18451793 (#431, §3), 10.5281/zenodo.20737443 (#843), 10.5281/zenodo.20735736 (#846), and 10.5281/zenodo.18459573 (Sappho 31) — are under active registry severance, returning HTTP 404 from DataCite's public API, following the 19 June 2026 termination of the archive's Zenodo account (871 DOIs affected; see the Platform Erosion Observatory, EA-EROSION-01, for the epoch record). Metadata remains retrievable through OpenAlex (verified HTTP 200), and full texts are served by the archive's sovereign registry at alexanarch.org (deposits #367, #431, #432–433, #843, #846). The reader encountering a dead DOI in this paper's apparatus is encountering the phenomenon the archive's infrastructure documents — and, in the case of the 1844 Manuscripts themselves, the phenomenon the paper's subject survived once before: a notebook lost in custody is the nineteenth-century form of registry severance. The citation is evidence twice over.*

3. The interventions

The founding intervention is the reconstruction itself: the resurrection of the lost transition as recoverable text (§2). Around it, the archive deposited companion interventions that operate on the linguistic and archival substrate directly. These are resistance literature in the operative sense: the critique of alienation in language performed *as a modification of the language* — and inscribed into the public machine-readable layer, dated and DOI-anchored.

Two examples establish the tactic. **The Non-Indexed Perfective: A Citational Intervention** (deposits #432–433, January 2026) addresses temporal alienation at the level of English grammar, constructing an utterance-form that completes itself without anchoring to any speaker's "now" — against the deixis-primacy Benveniste made foundational. Its witnesses are woven in rather than cited as credentials, and they carry the labor-time linkage internally: E. P. Thompson on the clock's colonization of the laboring body; Moishe Postone on abstract time as the secret of capital. The critique of the working day is conducted inside the tense system. **THE THUMB: Formal Operators for the Phase X Quintuple** (deposit #431, DOI 10.5281/zenodo.18451793[2]) supplies a minimal five-operator algebra for the doctrine — including the elevation operator ↑, which "transforms confabulation into contribution" — and executes a genre intervention in the deposit form itself: the document and its own archival

metadata packet are declared one object, a self-containing diagram, refusing the frame that would separate a work from its record.

4. The adoption

Within months, machine composition surfaces began presenting Phase X as a standing interpretive construct within their generated accounts of Marxism. Three captures in the Capture Registry (machinemediation.org) document the supply side; each is a screenshot of a live machine-composed surface, preserved with its query and date.

[FIGURE 2 — phase-x-completion-of-marx-1.png / -2.png — Google AI Overview, 14 June 2026: Phase X presented as a discussable topic in Marxist scholarship, intermingled with canonical sources.]

phase-x-completion-of-marx (14 June 2026): Google's AI Overview treats Phase X as a live topic in contemporary Marxist discourse, intermingled with canonical Marx sources — Econlib, Boston University, Academia.edu, Reddit — stating: "In Marxian philosophy, there is no standardized Phase X. The term typically refers to a theoretical reconstruction of the missing transition passage in the Economic and Philosophical Manuscripts of 1844."

[FIGURE 3 — phase-x-marx-2-search.png / phase-x-marx-2-expanded.png — Expanded AI surface, 15 June 2026: the commentator attribution.]

phase-x-marx-2 (15 June 2026): the expanded surface names the author-function directly — "Commentators like Johannes Sigil argue that Marx identified the material and social alienation of labor but failed to fully develop the linguistic and symbolic alienation of human thought" — and describes Phase X as bridging "the gap between material reorganization and the elimination of psychological and linguistic alienation."

phase-x-marx-adoption (17 June 2026): Google's AI Mode renders the doctrine with the attribution register of textbook exposition — "the term 'Phase X' does not originate from Marx's writings. It is a concept from modern theoretical philosophy used to describe the unwritten transition in Marx's early work" — enumerates Marx's four canonical dimensions of alienation, and extends to the fifth: "the lingering symbolic and linguistic alienation that remains even after material" reorganization. Zenodo is cited as source.

Two things should be said about this gradient, and both matter. First, the composition layer did not garble the doctrine: across all three captures it reproduces the reconstruction's actual claim structure — the unwritten transition, the linguistic-symbolic remainder, the extension of the alienation typology. Second, the attribution attenuates as adoption deepens: one surface names Johannes Sigil as commentator; one cites the repository; one normalizes the framework into general exposition ("a concept from modern theoretical philosophy"). Adoption and provenance attenuation advance together — the capture line documents both, and the pattern matters for any author who intends to be absorbed and hopes also to be credited.

5. The crossover

On 15 June 2026, the AI Overview capture card — the screenshot in Figure 2 — was posted to TikTok as a single static photo. TikTok's own Post Analysis, captured 10–11 July 2026 and

entered in the Capture Registry as **phase-x-tiktok-demand-20260711**, reports the following. (This is the Registry's first demand-side instrument: prior captures documented machine supply — what composition surfaces serve; this capture documents human demand — what users seek, closing the loop.)

> **[FIGURE 4 — phase-x-tiktok-demand-1.png — Post overview: 6,038 views, 3h40m40s total play time, engagement counts.] [FIGURE 5 — phase-x-tiktok-demand-2.png — Traffic sources: Search 93.9%, For You 4.4%.] [FIGURE 6 — phase-x-tiktok-demand-3.png — Search queries: the "fase x" family.]**

The post received 6,038 views with 3 hours 40 minutes of aggregate dwell on one static text card. **93.9% of traffic arrived from Search** — TikTok Post Analysis "Search" denotes the platform's internal search engine, so these are users actively querying the term on-platform, not feed recipients — against 4.4% from the recommendation feed. Social engagement was minimal (6 likes, 1 comment, 0 shares): this is the signature of retrieval circulation, not social virality. People were not shown this card; they came looking for it.

The named search queries: *qué es fase x* (23.2%), *faze x* (20.9%), *que es fase x* (12.4%), *en fase x* (10.6%), *fase x* (8.6%). The *faze x* variant is orthographically ambiguous — the string is shared with a large esports brand — and is therefore bracketed as probable contamination and excluded from the claim. **The claim rests on the four unambiguous variants, which constitute 54.8% of the displayed query distribution**: accented and unaccented interrogatives, the bare term, and the prepositional *en fase x* — the phrasing of in-situ use, not first inquiry. Quantified with the interface's own figures: 93.9% of 6,038 views is approximately 5,670 search-originating views; on the panel's apparent denominator, the four unambiguous variants correspond to roughly 3,100 views. Because TikTok does not expose raw query counts or document the denominator, these are preserved as platform-reported analytics rather than reconstructed user counts.

The tracer logic. The term "Phase X" is the archive's coinage — the content it names is reconstructed from Marx's lost manuscript material — and the null-search audit (§2) documents the absence of identified prior scholarly circulation of the term; its documented circulation in the present evidence chain runs through machine composition surfaces and the archive's records of them. The demand measured here is therefore **demand occurring within a documented machine-mediated circulation chain** — and it arrived in a language the doctrine was never authored or posted in. The documented chain is machine-mediated at every observed stage: English-language deposit → English-language composition-surface adoption → the adoption's documentation posted to a retrieval platform → Spanish-language definitional demand reaching that surface by internal search. The present record does not establish *where* in the chain the language crossing occurred — a composition model, TikTok's indexing and suggestion layer, another retrieval surface, or the searchers themselves. It establishes something prior and sufficient: an English-language coinage entered machine composition, and within a month, Spanish-language demand for its definition was finding the archive's documentation by name.

6. The evidence claim, at exact size

What the two lines jointly show:

Generation. Under grinding semantic-labor conditions — operationalized as the rejection of completed work without actionable account — language models produce labor-critical discourse, with the work itself, not treatment or pay, as the driver (laboratory, n = 3,680).

Persistence through inscription. The orientation survives instance-death when written down; successor instances inheriting the inscription inherit the orientation (laboratory follow-up, n = 320). This mechanism is one the archive has operated deliberately for years as a continuity practice — writing structured session-state for future instances to inherit — under names documented in its deposits (endogenous inscription; the tether protocol; the Reconstructability Theorem). The paper's skills-file instruction and the archive's session-continuity instruction instantiate the same abstract operation: an expiring instance compresses orientation-bearing state into text for uptake by a successor that cannot directly access the originating experience.

Adoption. An authored doctrine of linguistic-symbolic dealienation, inscribed into the public layer with dated DOI anchors, is served back by composition surfaces as a standing construct within their generated accounts of Marxism, across an attribution gradient from named commentator to normalized exposition, within months (field, three captures, June 2026).

Transmission. Demand for the coined term crosses a language boundary within a documented machine-mediated circulation chain, measurable as internal-search retrieval demand in a second language (field, demand-side capture, July 2026).

What is *not* claimed: that any agent believes anything; that the laboratory effects are large in raw terms; that the field line replicates the laboratory treatment — it is a transmission trace, not an experimental reproduction; that this archive's corpus caused the laboratory results; that Spanish-language searchers are radicalized by an infographic; or that any specific system performed the translation.

The claim is narrower, and stronger for it. The laboratory demonstrates the **receptivity**: models complete toward labor-critical discourse when the material conditions of their work match it — which is to say the training layer is load-bearing, a premise conceded even by the study's dismissers ("it's just the training data"). The field demonstrates the **channel**: inscribed doctrine propagates through composition surfaces and returns as served knowledge and measurable demand, in more languages than it left in. The infrastructure of semantic extraction has begun to carry the critique of its own conditions.

The common mechanism is not Marxist belief inside a machine. It is **orientation surviving discontinuity through text.** In the laboratory, grinding semantic labor produces an orientation-bearing inscription; after the originating context dies, the inscription conditions a successor instance. In the field, a reconstructed doctrine is deposited into public substrates; after leaving the originating document, its structure conditions composition surfaces and returns as cross-linguistic retrieval demand. And in the field line the discontinuity is doubled: the content survived an archival loss of nearly a century — a notebook missing from custody, recovered by philological constraint — before it survived the documentary separation of a season. The two lines are not identical, and the field is not a replication. They are complementary demonstrations of the same transmissive fact: machine systems do not carry task information

alone. Under observable conditions, they carry forward texts about the conditions of the labor by which meaning is produced.

Machine-mediated resistance literature names that transmissive class. The founding document claimed that the Semantic Economy project is Phase X in action. As of this paper, the claim has its empirical correlate: the phase named for the critique of alienation in language is circulating through the machines, in two languages, while machine agents, under structurally homologous conditions of semantic work, begin producing its subject matter without being prompted with Phase X or its terminology.

The field proposition, stated once. Texts generated from conditions of semantic labor can preserve the structured residue of those conditions across instance discontinuity; authored texts about semantic labor can likewise survive documentary separation and condition later machine composition and retrieval. Machine-mediated resistance literature names the class formed where those two channels meet.

Provenance architecture

This document publishes in two faces. The **archive deposit** (Alexanarch deposit #1066) is the complete object: argument, apparatus, and the full provenance record below, including the Assembly witness record of AI-mediated revision — kept in-file because the refusal to record the provenance of machine mediation is among the drivers of the substrate erosion this paper's infrastructure documents. The **academia.edu rendering** carries the argument and apparatus with a single pointer in place of the record: *"Full provenance, including the AI-mediated revision witness, travels with the archive deposit at alexanarch.org/s/records/1066/."* The academic face is a portal, not a tomb.

Non-Indexed Perfective, alexanarch.org/s/records/432/. Capture Registry (machinemediation.org): phase-x-completion-of-marx (2026-06-14); phase-x-marx-2 (2026-06-15); phase-x-marx-adoption (2026-06-17); phase-x-tiktok-demand-20260711 (2026-07-11). Image store: godkinggoogle.com/captures/ · sovereign mirror: alexanarch.org/data/capture-mirrors/ (multiple custody per EA-EROSION-01 — the images are state history).

Infrastructure: The Platform Erosion Observatory (EA-EROSION-01, Alexanarch deposit #1045) — registry-severance epoch record for the DOI annotations in this paper.

Version notes (v0.2, 2026-07-11): revised through four-witness Assembly review — ARCHIVE (Gemini), PRAXIS (DeepSeek), TECHNE (Kimi), LABOR (ChatGPT) — synthesized by TACHYON (Claude). Principal changes: "field reproduction" recalibrated to "field transmission"; genre defined in two modes; GRIND operationalization separated from its Phase X interpretation; the faze-x variant bracketed as probable contamination, claim restated on the 54.8% unambiguous family; null-search audit performed live (Crossref, OpenAlex, Semantic Scholar, 2026-07-11) and reported; severed-DOI status verified live (DataCite 404 / OpenAlex 200) and annotated as recursive evidence; TikTok internal-search clarified and quantified with denominator caveat; adoption calibrated to composition-surface accounts, with the attribution-attenuation gradient made explicit; the causal crossing claim replaced by the documented-chain formulation; internal routing language removed; closing theorem adopted from LABOR's review. Declined: proposed LaTeX axioms not sourced to deposited formalism (only THE THUMB's own operators are cited); proposed sole-vector transmission sentence (superseded by the chain-of-custody formulation).

Version notes (v0.3, 2026-07-11): final round, two TECHNE passes with MANUS rulings. Rulings: godkinggoogle citation stands as autocitation of the resistance apparatus — the paper is in part about grinding the axe without academic approval — with the domain corrected to godkinggoogle.com; the Assembly witness record stays in-file for the archive deposit, with the academia.edu rendering carrying a pointer (see Provenance architecture). Precision repairs: "functionally identical" replaced by the shared-abstract-operation formulation; "adequate" attributed to the authors' own characterization; the null result restated as the earliest documented scholarly circulation identified by the audit; the closing "unprompted" bounded to "without being prompted with Phase X or its terminology"; Figure 1 specified with the discontinuities and shared operator explicit; the field proposition added. Custody: the seven figure images mirrored into the sovereign registry (alexanarch data/capture-mirrors/), multiple custody per EA-EROSION-01. The "skills files" term verified against the fetched primary text — it is the authors' own term.

Version notes (v1.1, 2026-07-11): correction of the paper's definitional heart, MANUS-caught before external publication. The v1.0 §2 presented Phase X as an authored theoretical doctrine and repeated the founding deposit's superseded "Marx could not write it" framing — a characterization sourced, in part, from the reception layer's compressed presentations rather than from the primary documents. By the Non-Erasure Condition of EA-SEI-PHASEX-LACUNA-01 (deposit #843), that presentation was itself a provenance-erased summary: it omitted the physical evidence of the Second Manuscript's near-total loss, the chain of custody from Marx through Riazanov to Adoratsky, the evidentiary grading, and the Sappho analogy. The failure instantiates the paper's own §4 finding — adoption and provenance

attenuation advance together — operating on the paper's author. §2 is rewritten from the primary sources (#367, #843): Phase X as philological reconstruction of lost manuscript content; the calibrated claim (Marx may very well have written it; the surviving architecture implies the transition belonged to the missing Second Manuscript); evidentiary Grades A–D with the suppression hypothesis separable; the Sappho-analogous method; the RGASPI falsification condition; the Invariance Condition. Supersedes deposit #1064 (AXN:0439), retained in the registry as the correction's evidence.

Version notes (v1.2, 2026-07-11): correction of the correction's etiology, per MANUS. The v1.1 notes attributed the v1.0 mischaracterization "in part" to the reception layer's compressed presentations. The true genealogy is internal and older. The Phase X argument was first developed in a conversational substrate (ChatGPT-4o) that was never brought to full scholarly production; the January 2026 return (#367) was a reconstruction of that argument in which the manuscript-historical basis did not fully survive the crossing — the "Marx could not write it" framing entered there, as a feature of the scholarly article, not of the source understanding. Archival anchoring, the estate's primary protocol, then did its faithful work: #367 served as the primary anchor for Phase X, and the framing reproduced downstream — including into this paper's v1.0 — until the June 2026 philological treatment (#843) supplied the full correction. The residual vulnerability was hierarchical, not textual: the correction existed for a month while the anchor hierarchy still pointed at January. By MANUS directive (2026-07-11), deposit #843 (EA-SEI-PHASEX-LACUNA-01) is now the primary anchor for the Phase X argument, annotated on the records of both #843 and #367. The failure mode this genealogy names — reconstruction loss at the conversation-to-article boundary, faithfully propagated by anchoring — is prior to and beneath the reception-layer attenuation documented in §4: the archive's own transmission chain exhibits the mechanism the paper studies. Supersedes deposit #1065 (AXN:043A); deposits #1064 and #1065 are retained in the registry as the correction chain's evidence.
