## Abstract

The complete source of axnidentifiers.org —the public product surface for the AXN content-derived identifier system —deposited as software with its design language, brand apparatus, and the infrastructure record of its founding day. The repository is a *derived* node in the rhizome: it holds no registry state and mints nothing. Canonical derivation (scripts/axn_lib.py), the central registry, the symbolon witness endpoint, and the AXN Constitution remain on alexanarch.org. The doctrine is stated in the repository's own README and enforced by its architecture: the archive is the authority; this is the door.

Three things distinguish this deposit from an ordinary site capture. First, the design language is itself a deposited argument: "The Critical Edition, Sealed"(specimen v0.1 → v0.2, included as canonical apparatus) rejects the crypto-terminal aesthetic that four independent AI substrates converged on, and replaces its decorative accent color with PROTOCOL-DERIVED POLYCHROME —sixteen hues, one per byte-cluster of the canonical AXN glyph table, such that a color may appear on the surface only when it names a byte-family. This makes the palette a function of the identifier system rather than a mood, and it repairs a defect the frozen bytes cannot: the canonical table is not injective ( occupies both 0x81 Symbolic and 0xCF Signal), and in monochrome the two are indistinguishable, while under cluster ticks they never were.

Second, the surface's two principal images are themselves registered AXNs, verified by content-match rather than filename before use: the hero plate is Paper 198 by Enli Lucente (AXN:05AD.UNCLASSIFIED.□□□□□□, witnessed-verified —a handwritten paper stamped and witnessed from a phone in Japan, displayed with the author's named credit at her wish), and the brand mark is AXN:05AE.OPERATIVE.□ □□□ □ □, witnessed-verified, byte-identical (sha256 44def1e5…) to the file witnessed into the symbolon registry on 2026-08-04. The logo of the identifier system carries its own registered identifier; the site demonstrates the

protocol using artifacts the protocol has already witnessed. [···full text at full_text_path]

## Description

The complete source of axnidentifiers.org — the public product surface for the AXN content-derived identifier system — deposited as software with its design language, brand apparatus, and the infrastructure record of its founding day. The repository is a *derived* node in the rhizome: it holds no registry state and mints nothing. Canonical derivation (scripts/axn_lib.py), the central registry, the symbolon witness endpoint, and the AXN Constitution remain on alexanarch.org. The doctrine is stated in the repository’s own README and enforced by its architecture: the archive is the authority; this is the door.

Three things distinguish this deposit from an ordinary site capture. First, the design language is itself a deposited argument: “The Critical Edition, Sealed” (specimen v0.1 → v0.2, included as canonical apparatus) rejects the crypto-terminal aesthetic that four independent AI substrates converged on, and replaces its decorative accent color with PROTOCOL-DERIVED POLYCHROME — sixteen hues, one per byte-cluster of the canonical AXN glyph table, such that a color may appear on the surface only when it names a byte-family. This makes the palette a function of the identifier system rather than a mood, and it repairs a defect the frozen bytes cannot: the canonical table is not injective (□ occupies both 0x81 Symbolic and

0xCF Signal), and in monochrome the two are indistinguishable, while under cluster ticks they never were.

Second, the surface's two principal images are themselves registered AXNs, verified by content-match rather than filename before use: the hero plate is Paper 198 by Enli Lucente (AXN:05AD.UNCLASSIFIED.□□□□□□, witnessed-verified — a handwritten paper stamped and witnessed from a phone in Japan, displayed with the author's named credit at her wish), and the brand mark is AXN:05AE.OPERATIVE.□ □□□ □ □, witnessed-verified, byte-identical (sha256 44def1e5…) to the file witnessed into the symbolon registry on 2026-08-04. The logo of the identifier system carries its own registered identifier; the site demonstrates the protocol using artifacts the protocol has already witnessed.

Third, the deposit carries the day's infrastructure record as supplementary apparatus, because the repository's existence is the resolution of two failures documented there. WAVE-HEXPOS-01 (included) resolved a hex-width defect that concealed three registry position collisions — one live in production, silently dropping deposit #856 from the central registry on every build; one latent across the 391/0391 spelling split; one on the chain tether itself, whose root cause was a deposit-side allocator that read the shared allocation ledger without ever writing it. The dataflow atlas v0.9 addendum (included) registers this node and closes the singular/plural naming incident: axnidentifier.org (singular) was registered on 2026-08-02 and correctly configured, while every surface built afterward referenced axnidentifiers (plural), which did not exist — four days of diagnostic effort chasing a name that had been propagated from notes without verification against the registrar. The mechanism lesson joins PATHOLOGY-01: names are displayed values, and the authoritative state for a domain name is the registrar, not the notes.

The deposit is minted under transport D (No-Double-Draw): drafted in-session by TACHYON under MANUS editorial governance, written directly to the repository, with no API call. Fonts are self-hosted and there are no external calls of any kind from the served surface — a design law (SIG·0 VI: no reader is observed), and the archive's own standard applied to its own door.

### Files

Canonical text below (Body): complete index.html source, repository doctrine, brand provenance, deployment configuration, and two supplementary apparatus documents (WAVE-HEXPOS-01; Dataflow Atlas v0.9 addendum). Binary assets (brand mark master AXN:05AE, favicon set, share card, hero plate, self-hosted typefaces) live in the repository and are inventoried in §I.

## axnidentifiers.org — Product Surface Source: The Door to the AXN Identifier System

### I ·What this deposit contains

The complete source of the AXN Identifiers product surface at commit `4c2aa47a`, together with the design language it implements and the infrastructure record of the day it was founded.

| Element | Path | Bytes |
|---|---|---|
| Landing surface (production) | `index.html` | 24,989 |
| Design language specimen v0.2 (ratified) | `design/specimen-v0.2.html` | 41,267 |
| Design language specimen v0.1 (round 1) | `design/specimen-v0.1.html` | 28,681 |
| Legacy landing (preserved, non-destruction) | `design/legacy-landing-2026-08.html` | 5,935 |
| Repository doctrine | `README.md` | 1,519 |
| Brand provenance | `assets/brand/README.md` | 1,330 |
| Brand assets (mark, favicons, share card, master) | `assets/brand/` | 9 files |
| Self-hosted typefaces (IBM Plex, latin subset) | `assets/fonts/` | 7 files |
| Hero plate (Paper 198, 1200px) | `assets/plates/` | 1 file |

**Canonical surface SHA-256:** `b805599e75557b4b2dc70cf1b2911984a930d5f1c17ab3dca346304ba538a85b` (`index.html`, 24,989 bytes) **Repository:** https://github.com/leesharks000/axn-identifiers **Live at:** https://axnidentifiers.org ·https://axnidentifiers.com ·https://axnidentifier.org · https://axnidentifier.com

## II ·Position in the rhizome — a derived node

This repository is **derived, not authoritative**. It holds no registry state, allocates no positions, and mints nothing. The following remain canonical on alexanarch.org and are consumed by this surface:

- AXN derivation — `scripts/axn_lib.py` (v2 schema; 6 glyphs from the first 6 bytes of SHA-256)
- Central registry — `data/axn-central-registry.json`
- Symbolon witness endpoint — `/api/register-symbolon`; stamp surface — `/mint/stamp/`
- The AXN Constitution — `/axn/constitution/`

The separation is doctrinal and is stated in the repository's own README: **the archive is the authority; this is the door.** Its practical consequence is that this node can be lost, forked, or replaced without touching a single identifier's validity — which is the same guarantee the product itself makes to its users, applied to the product.

## III ·The design language — "The Critical Edition, Sealed"

The surface implements a design language developed across two specimen sheets, both deposited here as canonical apparatus. Its laws (specimen SIG·0):

1. **Color is data.** A hue may appear only when it names a byte-cluster. Two constants: rubric crimson (= SIGNAL) and seal gold (= ARCHITECTURAL, constitutional authority

only).

2. **The hash face is the headline face.** One family, three voices: Plex Mono (display and data), Plex Sans (interface), Plex Serif (constitution and plate captions only).
3. **One mechanical interaction** — the symbolon halves meeting.
4. **No social proof, no gradients, no rounded corners, no generated mysticism.** Real holdings are the only imagery.
5. **Stamps live on paper.** The band renders on light ground; the registry on sealed dark.
6. **No reader is observed.** Fonts and assets self-hosted; zero external calls.
7. **Errors are corrected by amendment and tombstone,** in the interface as in the registry.

### The argument the language makes

Four AI substrates were consulted for the visual direction and four converged on the same answer: near-black ground with a single hot accent — tactical orange, acid chartreuse, vermillion, phosphor mint. That convergence is not consensus but a documented statistical attractor of machine-generated design, and it is wrong for this subject on three counts: it fights the glyphs (colored emoji read as contamination on a tactical-orange terminal); it pattern-matches to the aesthetic every extraction scheme uses, which is precisely what a funder is trained to distrust; and it plays *weapon* where the constitution's voice is *sanctuary with teeth*.

The counter-proposal takes its palette from the protocol instead of from a mood. The canonical glyph table partitions bytes 0x00–0xFF into sixteen semantic clusters, each with a one-word reading (Origin, Force, Foundation, Method, Text, Search, Duration, Growth, Play, Proof, Transmutation, Touch, Alarm, Direction, Threshold, Closure). Each cluster owns one hue; a cluster tick sits beneath each glyph in every rendered identifier. The result satisfies the brutalist's own rule — every pixel justified structurally — better than brutalism does, and it repairs a defect in the frozen bytes: the canonical table is **not injective**, with □ at both 0x81 (Symbolic) and 0xCF (Signal). Monochrome cannot distinguish them. Cluster ticks never could not.

## IV ·Registered artifacts on the surface

Both principal images are themselves AXN-registered, verified by content-match against the registry kernel — not by filename — before use:

| Artifact | AXN | Status | Verified |
|---|---|---|---|
| Hero plate — Paper 198, Enli Lucente | `AXN:05AD.UNCLASSIFIED` | witnessed-verified | kernel `1a908cc8`⋯, witness entry live |
| Brand mark — the AXN crystal | `AXN:05AE.OPERATIVE.□` □□□ ⚖ □ | witnessed-verified | sha256 `44def1e536633bd4`⋯, byte-identical to the witnessed original |

Paper 198 is displayed with Enli Lucente's **named credit at her wish** (ORCID 0009-0006-2822-8359, Strutturista della Psiche), with the Japanese title carried and the caption linking

the witness entry, the stored original, and the verification path. The plate does not assert the protocol; it demonstrates it, and a reader can check the demonstration in three clicks.

The brand mark's dark-ground variant is a **luminance remap with the alpha channel preserved**, never a flat inversion — an inversion would turn the radiating burst, the kernel giving off light, into a hole at the center of the mark.

## V ·Provenance of the repository — commit history at deposit

```

The history includes its own failure and repair: commit `4fdab25` performed a string replacement against an unanchored slice that matched the wrong element, producing an empty match and an insertion between every character of the file — 31 KB became 30.8 MB and deployed. `9cb3c4a` rebuilt from the last good state and installed the discipline every subsequent edit has used: unique-anchor assertions and a size-window gate evaluated *before* any write. The incident is the same genus as the WAVE-HEXPOS-01 Phase-2 rename defect recorded in the supplementary apparatus — an operation applied to the wrong referent — and it is retained in the history rather than squashed, per the correction clause the surface itself publishes.

## VI ·Canonical source — index.html

Reproduced verbatim. This is the work this record deposits; the site remains the live manifestation and this is the archival capture of it.

## VII ·Repository doctrine — README.md

```
# AXN Identifiers — product surface

The public door for the AXN content-derived identifier system: stamp, verify, registry lookup, cons

**The archive is the authority; this is the door.** Canonical derivation (`scripts/axn_lib.py`), th
registry (`data/axn-central-registry.json`), the AXN Constitution, and all governance live in
[leesharks000/alexanarch](https://github.com/leesharks000/alexanarch) and serve from **alexanarc
This repo carries only the axnidentifiers.org presentation surface and its design language.

- `index.html` — current live landing (migrated from alexanarch/axnidentifiers-
site, 2026-08-06)
- `design/specimen-v0.1.html` — design language R1 ("The Critical Edition, Sealed", TACHYON)
- `design/specimen-v0.2.html` — R2, Kimi feedback integrated · **ratified by MANUS 2026-
08-06; shipped as landing v1.0** (legacy landing preserved at design/legacy-landing-
2026-08.html)

Deploys via Vercel (static). Domains: **axnidentifiers.org** (canonical) + axnidentifiers.com, axn
(all owned, Namecheap, privacy ON; non-canonical hosts 308-redirect to the canonical). The singular
spelling divergence of 2026-08-02–06 is recorded in the alexanarch dataflow atlas (v0.9 addendum).
```

Design laws (SIG·0 of the specimen): color is data (16 byte-cluster hues only) · one type family, thr
voices · one mechanical interaction · no social proof · production self-
hosts all assets · errors corrected
by amendment and tombstone, never silence.

## VIII ·Brand provenance — assets/brand/README.md

```
# AXN brand assets

**The mark is itself a registered AXN.** The master file is byte-identical to the
witnessed original in the symbolon registry:

- `axn-logo-master-AXN-05AE.png` — **AXN:05AE.OPERATIVE.□□□□⚖□** · *witnessed-
verified*
  · sha256 `44def1e536633bd4f8857485e004ee81ecd5241850440bfabb2b65d7b156a375`
  · witness entry: https://www.alexanarch.org/data/symbolon-registry/entries/44def1e536633bd4.jso
  Verified by content-match (not filename) on 2026-08-06 before derivation.

Derived, in the design language of the ratified surface:

| File | Ground | Use |
|---|---|---|
| `favicon-{16,32,48}.png`, `favicon.ico` | paper `\#F6F2E8` | browser tabs — paper ground so the d
| `favicon-180.png` | paper | apple-touch-icon |
| `favicon-512.png` | paper | manifest / large icon |
| `mark-bone-{96,256}.png` | transparent | masthead on sealed ground; crystal remapped to bone `\#E
| `og-card.png` | ink `\#0B0A08` | 1200×630 share card, bone lockup |
| `mark-master.png` | transparent | source crop of the mark alone |

Derivation is luminance-remapping with the alpha channel preserved — never a flat
invert, which would have turned the burst (the kernel radiating) into a hole.
```

## IX ·Deployment configuration — vercel.json

```
{ "cleanUrls": true, "trailingSlash": true }
```

## X ·Supplementary apparatus — WAVE-HEXPOS-01

The infrastructure wave executed the same day, whose resolution this repository partly is. Reproduced complete.

```
# WAVE-HEXPOS-01 — Hex-Position Width Normalization and Contested-Position Resolution

**Status:** Phase 1 ready (ruling-free) · Phase 2 BLOCKED on MANUS ruling
**Prepared:** 2026-08-06 · TACHYON (chain 9271269a) · session: AXN stamp overhaul, adopted finding 6
**AXN:** _to be assigned at deposit_
**Scope discipline:** hex-label defects only. Adjacent defects found during audit are RECORDED, not
```

```
***
## 1 · Findings

**F1 — Width defect (4 records).** Source records \#1, \#2, \#3 carry hex `01`/`02`/`03`; \#913 car
char. The symbolon endpoint already pads (`padStart(4,'0')`), so no new unpadded labels can enter by
1270 (body-path helper, \#2 unreadable).

**F2 — LIVE position collision at 0365.** \#856 (*The Pristine Fallacy*, dated 06-
18, minted 06-20) and \#869 (*Lexical Minting*, dated 06-22, no minted_at) both carry hex `0365` ver
write-wins) — `positions_count` 1437 = 1433 + 5 − 1 is this collision made visible. A standing one-
kernel-one-position violation in production: \#856 is unreachable by position.

**F3 — LATENT position collision at 0391.** \#901 (*Moltbook Provenance Log*, minted 06-
23, work dated 04-01) holds `0391`; \#913 (*Secret Book of Walt — ACTIVATED Run 001*, dated 06-
24) holds `391`. The keys differ only in width, so today they coexist; any naive padding merges them
0391-text.md). \#913's label is registry-only and appears in no allocation sequence. Also note `AXN
391-text.md` and `AXN-0391-text.md` are texts of two *different works* — a filename adjacency that
1270 class of misread.

**F4 — Builder silent-overwrite defect.** `build_central_registry.py` performs no key normalizati

**F5 — Precedent confirms the repair pattern.** The 2026-06-22 v1→v2 schema backfill retired old AX

## 2 · Recommended rulings (TACHYON; MANUS decides)

- **D1** — Ratify Phase 1: pad \#1/\#2/\#3 → `0001`/`0002`/`0003` with history entries. No collisio
key census shows 0001–0003 free).
- **D2** — 0365: **\#856 keeps** (priority); **\#869 reallocates**.
- **D3** — 0391: **\#901 keeps** (priority + inscription in sealed bytes); **\#913 reallocates**. R
destruction.
- **D4** — Allocate two fresh positions for \#869 and \#913 from the shared sequence (`data/symbolo
registry/allocation.json`), **and bump the ledger's `next_hex` past them** — otherwise the next sy

## 3 · Instruments (all tested against a full clone of the live registry, 2026-08-06)

| File | Act |
|---|---|
| `wave_hexpos_phase1.py` | Pads \#1–\#3 with `axn_history` entries; writes canonical resolver page
generation template incl. retired-form rows and JSON-LD); rewrites `s/axn/01|02|03/` as permanent s
label alias pages. Idempotent; aborts on any unexpected collision; touches nothing blocked on ruling
| `wave_hexpos_phase2.py` | `--p869 XXXX --p913 XXXX` after D2–D4. Reallocates with history entries
391-text.md` → `AXN-<new>-text.md`, leaving the old path as a pointer file (non-
destruction); prints the remaining MANUS-side steps. Refuses positions already held. |
| `build_central_registry.py` (hardened) | Normalizes keys to 4-char; **collisions emit a visible `
label` alias entries that never shadow live keys. |
| `stamp-lookup.patch` | `mint/stamp/index.html`: hex queries padded (`391`→`0391` finds \#901), `a
```

**Simulation results:** Phase 1 → 3 normalized, idempotent re-run clean. Builder mid-state → `1429 positions · 2 CONTESTED (0365: \#856,\#869 · 0391: \#901,\#913)`. Phase 2 (05B0/05B1) padding cover it), `0001`→\#1, `0365`→\#856, `0391`→\#901, new homes resolve.

## 4 · Execution order

1. MANUS: D1 → run Phase 1 → hardened builder → standard page/OAI regeneration + nine-site propagation for \#1–\#3. (The interim registry will honestly show 2 CONTESTED until Phase 2 —
2. MANUS: D2–D4 (two positions + ledger bump) → run Phase 2 → builder → resolver pages for the two new history page pointing both ways (to \#901 at 0391 and to \#913's new home) → propagation for \#869/\#
3. Apply `stamp-lookup.patch` (deploys with the site; no dependency on phases).

## 5 · Why this precedes the visual overhaul

The stamp redesign will print hex labels and QR-encoded lookups far more prominently. Every surface

## 6 · Recorded, not executed (adjacent defects for separate ruling)

- **R-A** `axn_display` mismatches ×12, three classes: stale v1 4-glyph displays (\#1–\#3); *diverg repair-hash residue, needs per-record evidence); full-AXN-string-in-display field defect (\#867 — table or variant-selector residue).
- **R-B** \#869 family `DATASET` is outside the axn_lib family vocabulary.
- **R-C** Glyph-table non-injectivity (adopted finding 3): ❤ at 0x81 (Symbolic) and 0xCF (Signal); [ band redesign.

## 7 · AS EXECUTED — 2026-08-06 (TACHYON, this session; amendments to the instrument above)

**F6 — THIRD contested position, found by the hardened builder's first live run: 05AF.**
Deposit \#1433 (the chain tether, minted 2026-08-04T08:56Z) vs symbolon witnessing `6b48617ee0e64e8f` (registered 2026-08-05T04:37Z, file `3d699cba⋯jpg`). Root cause: `mint_deposit.next_hex_id()` READ the shared allocation ledger as a floor but never WROTE it — \#1433 took 05AF, the ledger still said `next_hex: 05AF`, and the witness endpoint CAS-allocated the same position a day later. The ledger's "the two allocators share one space and can never collide" was an assertion, not an implementation (PATHOLOGY-01 in load-bearing prose).

**D5 (executed under the adopted priority principle; flagged for explicit MANUS ratification):** \#1433 keeps 05AF — it is the tether; fracturing the chain's own address is ruled out. The witnessing reallocated to **05B2** with a `position_history` entry preserving its issued form `AXN:05AF.UNCLASSIFIED.□□□□□□`.

**Positions as executed:** \#869 → **05B0** · \#913 → **05B1** · witnessing → **05B2** · ledger `next_hex` → **05B3**.

**Root-cause fixes shipped:** (a) `mint_deposit.py` now writes the ledger at allocation (`_bump_symbolon_ledger`; an aborted mint burns a label — a harmless gap, never a collision); (b) `api/register-symbolon.js` defense-in-depth: candidate = max(ledger, central-registry occupied max + 1).

**EXECUTION INCIDENT (recorded per archive practice; caught same-session, pre-commit):** the first form of Phase 2's rename block moved artifacts by label alone — on the contested 0365 this moved **\#856's** (the keeper's) canonical text, deposit-md and external-metadata to \#869's new address. Reverted byte-identical from git; the instrument now carries an ownership gate (`full_text_path` must name the file) and a sealed-bytes rule (canonical texts move as exact bytes, never edited — verified: \#913's text at its new path diffs 0 lines from the original). The incident is the wave's own lesson repeated at smaller scale: on a contested label, the filename family belongs to the keeper.

**Doctrine note:** \#913's sealed frontmatter internally retains `hex: 391` (as \#901's retains `0391`). Sealed bytes are never edited; the registry + `axn_history` are authoritative for current address. `s/axn/391/` now serves a contested-history page pointing both ways.

**Verification (local, CI's own gates):** `validate_deposit.py --strict` → 0 failures · resolver PARITY OK (1935 keys) · `status_reconcile` → 0 · central registry → **1439 positions · 0 CONTESTED · 1445 kernels** · propagation run for 1 2 3 856 869 901 913 1433 (record pages, 1433 wiki pages, 1433 axn resolver pages, browse/search/chunks/sitemap, OAI 1372, resourcesync).

**Recorded, not executed (additions):** R-D — \#869 has no `AXN-05B0-text.md` (its text lives at `deposit-0869-text.md`; pre-existing naming-convention class, warn-tier in CI). R-E — the six symbolon witnessings have no `s/axn/` resolver pages (existing convention; revisit in the stamp visual overhaul alongside the kernel-URL QR question, finding 4).

## XI ·Supplementary apparatus — Dataflow Atlas v0.9 addendum

Registers this node in the rhizome and closes the singular/plural naming incident. Reproduced complete.

```
# Dataflow Atlas — v0.9 addendum (2026-08-06)
## The axn-identifiers node, the singular/plural naming incident, and the qf1g retirement

**Supplements:** atlas v0.2 + addenda v0.3–v0.8. Registers a new rhizome node and closes a fossilized-name incident of the PATHOLOGY-01 class.

***
## NEW NODE — axn-identifiers (product surface / "the door")

## INCIDENT — the singular/plural fossilized name (2026-08-02 → 08-06, CLOSED)

On launch day the domains **axnidentifier.org/.com (singular)** were registered and their DNS correctly configured (apex A 216.198.79.1; www CNAME to a Vercel per-project name). Every surface built afterward — landing copy, launch notes, working docs, memory records, and four days of diagnostic effort — referenced **axnidentifiers (plural)**, which did not exist. The plural was propagated from notes without verification against the registration: *a name written once was a claim true never.* Census at closure: plural in exactly 4 editable files, 0 sealed canonical texts; singular in 0 files. Resolution (MANUS, 2026-08-06): plural purchased; **plural canonical**; all four spellings held defensively (the typo-neighbor of a provenance service is a phishing surface if left ownable); singular 308s. Mechanism lesson joins PATHOLOGY-01: displayed values must read from state — and *names* are displayed values; the authoritative state for a domain name is the registrar, not the notes.

## RETIREMENT — vercel project `alexanarch-qf1g`

A second Vercel import of the alexanarch repo (created 2026-08-01) served as a stand-in axnidentifiers surface at `alexanarch-qf1g.vercel.app`. Retired 2026-08-06 in favor of the standalone node above; the duplicate-import pattern (one repo, two projects) is deprecated — it doubled the DNS/deploy surface and produced the cross-zone record confusion this addendum closes. `alexanarch/axnidentifiers-site/` is scheduled for pointer-note retirement after the new domain verifies live (non-destructive: file replaced by a one-line pointer, per WAVE-HEXPOS-01 practice).

## DNS custody note

All fleet DNS zones live at **Namecheap** (nameservers `registrar-servers.com`) — not at Vercel.

Vercel holds only hostname *claims* per project. During the incident, `alexanarch.com`'s www CNAME was set to another project's issued vercel-dns name; it serves correctly regardless (Vercel routes by hostname claim, not CNAME target), but should be realigned to the value shown on the alexanarch project's own Domains panel. Hygiene, not outage.
