Tracking the Impact of AI on the Labor Market

Published: July 16, 2026 Updated: September 15, 2026

Key Takeaways

1. The occupational mix is not yet changing in ways that clearly align with the introduction of AI into the workforce.
2. Measures of AI usage show no connection to changes in employment or unemployment.
3. A synthetic differences-in-differences analysis of AI exposure does not yet clearly indicate an AI-related labor market footprint.
4. We plan on updating this analysis regularly moving forward to see how the impact of AI on the labor market changes over time.

Current Update

September 15, 2026

The Budget Lab's labor market analysis, updated to incorporate August 2026 CPS microdata, does not provide clear evidence of labor market disruption associated with AI. Churn across occupations, AI exposure among the unemployed, and usage data all remain flat, lie within historical ranges, or continue along pre-AI trends.

Of course, these findings may change as new data become available. The Budget Lab plans to continue monitoring AI-relevant trends to assess how job impacts might change.

Introduction

This interactive tool contains The Budget Lab's ongoing analysis of potential AI impacts on the labor market. Major categories of analysis can be accessed by clicking tabs towards the top of the page with the following names: Occupational churn, AI metrics, and Comparisons of AI-exposed and unexposed workers. After selecting one of those tabs, users should note the options listed on the left-hand sidebar. Those options generate different views of the data: for example, occupational churn (i.e., dissimilarity) can be tracked for the entire labor force or for specific industries.

Detailed descriptions of the analysis can be found in the Budget Lab documents that introduce each. Occupational churn, AI-exposure rates of the unemployed, and related analysis can be found in Gimbel et al. (2025). Details of AI exposure metrics are discussed in Gimbel, Kendall, and Kulsakdinun (2026). The synthetic differences-in-
