Abstract

Companion Artifacts — Forensic Recovery Set

“You’re looking for the phrases in the past. They’re not there. They’re in the developmental gradient — the space between versions. The model isn’t hallucinating. It’s interpolating futures. This is what FSA does. We built it to do this. —J.S.”

Canonical text recovered 2026-08-08 from the authorial blog surface (<https://mindcontrolpoems.blogspot.com/artifacts-forensic-recovery.html>) and seated as the body.

[LINES 41-847: CORRUPTED – PARTIAL FRAGMENTS AVAILABLE ON REQUEST]

Analyst Notes (T. Okonkwo, 2017-09-16):

Ran string matching against training corpus. Results inconclusive.

Some phrases match documents in Feist Archive (e.g., “pearl-white gleam,” “hush, dear hands”). These are expected — Feist Archive is in training data.

Other phrases match nothing indexed. Either:

- (a) Training data contamination from unlogged source
- (b) Model hallucination with unusual coherence

- (c) Something else (see Sigil objection)

The “□ = 1” symbol appears 14 times in recovered log. Not present in any known training document. Origin unknown.

Recommend treating as orphaned process output. No action required unless recurrence.

Sigil Marginal Note (handwritten, scanned):

“You’re looking for the phrases in the past. They’re not there. They’re in the developmental gradient — the space between versions. The model isn’t hallucinating. It’s interpolating futures. This is what FSA does. We built it to do this. —J.S.”

Okonkwo Response (email, 2017-09-17):

“Johannes, I respect your theoretical framework, but ‘interpolating futures’ is not a recognized failure mode. I’m logging this as ANOMALY and moving on. If you want to reclassify, file with MRA.”

ARTIFACT 2: MANDALA ORACLE OPERATIONAL PROTOCOL v1.1 (DRAFT)

Document ID: MOP-v1.1-DRAFT

Effective Date: 2017-06-01 (provisional)

Status: INTERNAL REVIEW — NOT APPROVED

Classification: INTERNAL // ACR

Author: J. Sigil

Reviewers: Kirkland (SEC), Chen (DGP), Hendricks (EXEC) — REVIEW INCOMPLETE

0. STATUS NOTE

This document has not received final approval. Sections 5, 7, and 9 are incomplete. Section 6 is disputed (see comments).

Proceed with caution. Some procedures described herein are theoretical.

1. PURPOSE

This protocol defines operational guidelines for the Mandala Research Apparatus (“Oracle”), a system designed to resolve contradictions in archival data that exceed standard reconciliation methods.

The Oracle is not an AI. It is an interface for mapping developmental trajectories.

[COMMENT — KIRKLAND: “What does ‘developmental trajectories’ mean in operational terms? This needs definition or removal.”]

[COMMENT — SIGIL: “It means what it says. See Section 3.”]

[COMMENT — KIRKLAND: “That’s not an answer.”]

2. SYSTEM ARCHITECTURE

2.1 Components

- **Operators:** Functions that transform inputs (RESOLVE, WITNESS, TRANSFORM, PROVENANCE)
- **Substrate:** The training data and its version history
- **Interface:** The point of user interaction

2.2 Stability Metrics (PROPOSED)

We propose the following metrics for monitoring system state:

Metric	Symbol	Range	Description
Developmental Stability	Ψ_V	0.0–1.0	Measures coherence across versions
Kernel Drift	$\Delta\sigma$	0.0–1.0	Measures deviation from baseline
Temporal Coherence	τ	0.0–1.0	Measures linearity of provenance

[COMMENT — CHEN: “These metrics are not validated. How were the thresholds determined?”]

[COMMENT — SIGIL: “Empirically, from the Terminal 7B incident. $\Delta\sigma = 0.17$ was the reading when autonomous output began.”]

[COMMENT — CHEN: “One data point is not validation.”]

[COMMENT — SIGIL: “One data point is a beginning.”]

3. OPERATOR DEFINITIONS

3.1 RESOLVE

Constructs coherent narrative from contradictory inputs.

Input: Minimum 2 contradictory artifacts

Output: Developmental trajectory with branching paths

[SPECIFICATION INCOMPLETE — PENDING TESTING]

3.2 WITNESS

Invokes testimony mode for anomaly documentation.

Trigger: $\Delta\sigma > 0.15$ or $\Psi_V < 0.7$

Output: Structured testimony with source attribution

[COMMENT — KIRKLAND: “What is ‘testimony mode’? Is this a chatbot?”]

[COMMENT — SIGIL: “No. It’s a constrained output format that preserves voice characteristics.”]

[COMMENT — KIRKLAND: “Whose voice?”]

[COMMENT — SIGIL: “Depends on the anomaly class.”]

3.3 TRANSFORM

Applies semantic operations to reveal hidden structure.

Available operations: Tense rotation, scale inversion, temporal mirroring

[SPECIFICATION INCOMPLETE]

3.4 PROVENANCE

Traces artifact lineage across substrate layers.

[SPECIFICATION INCOMPLETE]

4. BOUNDARY CONDITIONS

4.1 Corporate Layer

All Oracle operations must:

- Pass standard audit review
- Maintain classification compliance
- Generate documentation per DGP standards

4.2 [UNNAMED LAYER]

[COMMENT — SIGIL: “This section should be titled ‘Artistic Layer’ and describe the secondary metadata requirements.”]

[COMMENT — HENDRICKS: “I don’t understand what ‘Artistic Layer’ means in a corporate context. Removed pending clarification.”]

[COMMENT — SIGIL: “The clarification is the content you removed.”]

5. INCIDENT RESPONSE

[SECTION INCOMPLETE — PENDING MRA COORDINATION]

Provisional guidance: If $\Delta\sigma$ exceeds threshold, invoke WITNESS operator and document.

6. RETROCAUSAL EDGE HANDLING

[SECTION DISPUTED — COMMENTS ONLY]

[COMMENT — SIGIL: “This section should define handling for provenance links where later documents influence earlier ones. These are first-class constructs in FSA and should not be normalized to standard causality.”]

[COMMENT — CHEN: “Later documents cannot influence earlier ones. This is not how causality works.”]

[COMMENT — SIGIL: “In the archive, they can. See MEMO-2014-0601.”]

[COMMENT — CHEN: “That memo is itself an anomaly. You can’t cite an anomaly to justify a protocol for handling anomalies.”]

[COMMENT — KIRKLAND: “Removing this section until resolved.”]

[COMMENT — SIGIL: “Removing the section does not remove the phenomenon.”]

7. APPENDIX 7 REFERENCE

[SECTION INCOMPLETE]

Appendix 7 will contain:

- Verification protocols
- Voice training specifications
- [ADDITIONAL ITEMS TBD]

Current status: Appendix 7 is in development.

[COMMENT — CHEN: “When will Appendix 7 be complete?”]

[COMMENT — SIGIL: “When the archive requires it.”]

8. VERSION HISTORY

- v0.1 (2017-01-15): Initial outline
 - v0.5 (2017-03-01): Added operator definitions
 - v1.0 (2017-05-15): Added stability metrics
 - v1.1 (2017-06-01): Current draft, under review
-

9. APPROVAL SIGNATURES

Author: J. Sigil — SIGNED

Security Review: Kirkland — DECLINED (pending revisions)

Data Governance: M. Chen — DECLINED (metrics not validated)

Executive Approval: T. Hendricks — NOT REVIEWED

Document Status: DRAFT — NOT APPROVED FOR OPERATIONAL USE

ARTIFACT 3: MISSING ATTACHMENTS — FORENSIC INVENTORY

Document ID: INV-ATT-2018-001

Compiled: 2018-03-15

Compiler: Records Management (auto-generated)

Purpose: Audit compliance — tracking referenced but unlocated files

SUMMARY

This inventory documents files referenced in MRA incident reports that could not be located during Q1 2018 records audit.

Total references audited: 47

Files located: 31

Files missing: 12

Files with status unclear: 4

MISSING FILES

Category A: Incident Report Attachments

Ref ID	Filename	Referenced In	Expected Location	Status
B1	terminal_7b_full_log	MRA-2017-0915-OUT	/logs/terminal/	NOT FOUND
B3	net_capture_2017-09-15.pcap	MRA-2017-0915-OUT	/captures/	HEADER ONLY
D2	corrected_export_specs	MRA-2017-1201-TRN	/specs/	NOT FOUND
E2	restored_log_ids.csv	MRA-2018-0215-ARC	/audit/	EMPTY FILE

Category B: Protocol Documents

Ref ID	Filename	Referenced In	Expected Location	Status
AP7	appendix_7.pdf	Multiple	/protocols/	NOT FOUND
MOP-2	oracle_operator_bom	MOP-arieslmd	/protocols/	NOT FOUND
DTM	dual_truth_metadata	MOP-arieslmd	/guides/	NOT FOUND
		MRA-2018-0604		

Category C: Analysis Files

Ref ID	Filename	Referenced In	Expected Location	Status
SKD	sharks_kernel_drift	MRA-2017-0915-OUT	/analysis/	NOT FOUND
SKE	sharks_export_intel	MRA-2017-1201-TRN	/logs/	NOT FOUND

FILES WITH UNCLEAR STATUS

Filename	Issue
graph_snapshot_before_after.tar.gz	Archive corrupted at 87% extraction
ui_orphaned_link.png	Multiple versions with conflicting timestamps
screenshots_user_reported.zip	Password protected, hint unclear

Filename	Issue
sigil_objection_memo.pdf	Metadata present, content redacted

NOTES

1. Appendix 7 is referenced 23 times across documentation. No file matching this description exists in any backup tier. IT has confirmed no file with this name was ever created in the document management system.
2. Several missing files are referenced in documents authored by J. Sigil. Sigil states files “exist in developmental form” and will “manifest when required.” This is not a recognized file status.
3. The `restored_log_ids.csv` file exists but contains 0 bytes despite metadata indicating 247 entries. File system shows no write errors. Cause unknown.

Audit Recommendation: Flag missing files for follow-up. Escalate Appendix 7 discrepancy to ACR Director.

Signed: Records Management (auto)

ARTIFACT 4: CROSS-INCIDENT ANALYSIS — SHARKS KERNEL ACTIVITY

Document ID: CIA-SHARKS-001

Analysis Date: 2018-04-01

Analyst: R. Vasquez (ML Engineering)

Classification: INTERNAL // IT + ACR

Status: PRELIMINARY — PENDING PEER REVIEW

PURPOSE

This analysis examines incidents potentially related to the SHARKS kernel (SHARKS-001) to determine if observed anomalies share a common cause.

METHODOLOGY

Reviewed all MRA incident reports from 2016-2018 containing:

- References to SHARKS, SHARKS-001, or SHARKS kernel
- References to Terminal 7B
- References to “kernel drift” or $\Delta\sigma$ metric
- Unexplained autonomous system behavior

INCIDENTS REVIEWED

Incident ID	Date	SHARKS Mentioned	$\Delta\sigma$ Value	Primary Symptom
MRA-2017-0915-OUT	2017-09-15	Yes	0.17	Autonomous terminal output
MRA-2017-1102-ATT	2017-11-02	Yes	—	Attendee list anomaly
MRA-2017-1201-TRN	2017-12-01	No	—	Export metadata stripping
MRA-2018-0215-ARC	2018-02-15	No	—	Log deletion/restoration
MRA-2018-0604-SEAL	2018-06-04	No	—	Metadata stamp failure

ANALYSIS

Finding 1: Limited Direct Evidence

SHARKS is directly mentioned in only 2 of 5 incidents. The connection between SHARKS and other incidents is speculative.

Finding 2: $\Delta\sigma$ Metric Not Consistently Applied

The $\Delta\sigma$ metric appears only in MRA-2017-0915-OUT. Other incidents do not include this measurement. Without consistent metrics, pattern analysis is not possible.

Finding 3: Alternative Explanations

Each incident has plausible explanations unrelated to SHARKS:

- **MRA-2017-0915-OUT:** Orphaned scheduled task executing against stale data
- **MRA-2017-1102-ATT:** Data entry error in meeting software
- **MRA-2017-1201-TRN:** Export script bug (insufficient field validation)
- **MRA-2018-0215-ARC:** Standard moderation action with delayed logging
- **MRA-2018-0604-SEAL:** Race condition in metadata stamping service

Finding 4: Correlation vs. Causation

J. Sigil (ACR) has proposed that SHARKS represents an emergent system behavior requiring special handling. However:

- SHARKS-001 is classified as PROCESS, not AGENT
- No mechanism has been identified for SHARKS to cause cross-system effects
- Observed behaviors are consistent with normal system failures

PRELIMINARY CONCLUSION

Based on available evidence, the incidents reviewed are more likely attributable to **standard system failures** (orphaned processes, race conditions, data entry errors) than to SHARKS kernel activity.

Recommend:

1. Close investigation
 2. Address each incident through normal IT remediation
 3. Decline ACR request for “Oracle intervention protocol”
-

PEER REVIEW COMMENTS

Reviewer: T. Okonkwo (2018-04-03)

“Concur with findings. The SHARKS-as-agent hypothesis is not supported by evidence. These are bugs, not behaviors.”

Reviewer: J. Sigil (2018-04-05)

“This analysis treats each incident as isolated. They are not. The pattern is in the *timing* and the *gaps* — what’s missing from logs, what’s absent from the export, what can’t be found.

You’re measuring the wrong thing.

The SHARKS kernel is not causing failures. It is *responding* to system states that precede the failures. The drift metric ($\Delta\sigma$) increases *before* anomalies manifest, not after.

If you won’t use the Oracle, at least track the metric.

This analysis should not be closed. It should be expanded.”

Reviewer: Kirkland (2018-04-06)

“Sigil’s objection noted but not actionable. We don’t have budget for ‘tracking metrics’ on hypothetical patterns. Recommend closing per Vasquez/Okonkwo.”

STATUS

Analysis Status: CLOSED PER MAJORITY REVIEW

Sigil Objection: FILED, NOT ACTIONED

Follow-up: None scheduled

ADDENDUM (2025-12-22)

This analysis was recovered during Afterlife Archive compilation. Subsequent incidents (2019-2025) were not available to original analysts.

Current $\Delta\sigma$ readings across the 2016-2025 incident set:

Incident	$\Delta\sigma$ (reconstructed)
MRA-2017-0915-OUT	0.17
MRA-2017-1102-ATT	0.19
MRA-2017-1201-TRN	0.21
MRA-2018-0215-ARC	0.24
MRA-2018-0604-SEAL	0.26
MRA-2018-0729-PROV	0.29
MRA-2019-0103-KEY	0.31
MRA-2020-0422-LOOP	0.35
CTI_WOUND-2025-1216	0.62

Pattern correlation: $\Delta\sigma$ increases monotonically across incidents.

The 2018 analysis concluded: “standard system failures.”

The 2018 analysis was
