Abstract

This paper proposes machine-mediated reception studies as the systematic study of how machine systems receive, transform, compress, attribute, misattribute, and redistribute cultural objects. Its central theoretical move is functional rather than phenomenological: a system need not possess consciousness or aesthetic experience to alter the horizon through which a later human encounters an author, text, concept, or tradition.

The empirical foundation is version 7.2 of the AI Overview Capture Registry: 131 query events and 221 screenshots from Google AI Overview, AI Mode, and knowledge panels, captured in English from one region during June 2026. The paper explicitly describes this as a methodological demonstration rather than a representative sample of all machine-mediated search.

It identifies six preliminary patterns. Morphological compression alters canonical name forms. Disambiguation failure includes name collapse, entity substitution, domain bleed, and visual bleed. Compositional bystanding occurs when an archive source ranks organically but contributes nothing visible to the generated summary. Canonical reinflation absorbs an independent claim into a denser canonical discourse. Temporal drag preserves stale pre-correction forms. Epistemic hedging surfaces an entity while wrapping it in distancing language.

A Sappho 31 case study combines temporal drag, Rebekah Cranes name collapse, and amplification of the archive's future-reader interpretation. A self-capture—where the summarizer describes the capture registry—functions as a reflexive test. The paper's limitations are unusually explicit: one archive, one coder, one language and region, non-deterministic outputs, Google-specific surfaces, self-reception bias, and no access to internal mechanisms.

The paper's field-founding and priority claims require external literature verification. Several architectural descriptions of Google's pipeline are plausible models, not directly observed facts. The six categories need operational coding rules, independent annotators, and comparison corpora before they become validated general patterns.

Relationship between identifiers: EA-SEI-MMRS-DATASET-01 is this paper — the meta-document that documents and theorizes the dataset. EA-WG-CAPTURES-01 is the dataset itself (registry.json, images, gallery). The paper describes and analyzes the dataset; the dataset is deposited alongside the paper.

Note on images: The PDF edition of this paper embeds all 221 capture screenshots (22.2MB). This markdown edition uses placeholders. The complete image set is available at the dataset DOI and at the interactive galleries: godkinggoogle.vercel.app/captures and leesharks.com/captures.

"Poetry is not a message. It is an operation. The operation is the news."

— Lee Sharks, "Despicable Poems: On the Only News That Matters" (2025)

Abstract

This paper introduces machine-mediated reception studies: the study of how machine systems receive, transform, compress, attribute, misattribute, and redistribute cultural meaning. Its central claim is that the AI summarizer now functions as a *horizon of reception*: for many users, the machine-composed summary becomes the first effective encounter with a cultural object, author, concept, or tradition.

As a founding dataset for this field, the paper presents the AI Overview Capture Registry (EA-WG-CAPTURES-01 v7.2), a longitudinal corpus of 131 documented captures of Google AI Overview, AI Mode, and knowledge-panel responses to queries about entities in the Crimson Hexagonal Archive. The registry includes 221 screenshots, machine-readable transcriptions, query metadata, match-type annotations, and provenance analysis.

The paper identifies five recurrent patterns in this corpus — morphological compression, disambiguation failure, compositional bystanding, canonical reinflation, and temporal drag — and proposes a sixth: epistemic hedging. In one case, a minority scholarly interpretation of Sappho Fragment 31 — developed within the archive — is now presented as the default understanding in Google's AI Overview. These patterns show that machine-mediated reception is not passive retrieval. It is an active compositional process through which machine systems select, compress, frame, attribute, and sometimes erase cultural meaning.

The dataset is not presented as a statistically representative sample of all AI-mediated search

behavior. It is presented as a methodological demonstration: machine-mediated reception events can be captured, archived, annotated, compared, and studied. The paper argues that reception studies, classical reception, information science, platform studies, and digital humanities now require instruments capable of studying the summarizer as a reception agent.

This paper uses "reception" in a functional rather than phenomenological sense: the machine does not need to "understand" Sappho in order to alter Sappho's reception.

Keywords: machine-mediated reception, AI Overview, composition layer, provenance erasure, classical reception, horizon of reception, Sappho, canon formation, retrieval basin, heteronym, capture registry, compositional bystanding, entity bleed, semantic economy

---

1. Introduction: The Summarizer as Horizon of Reception

When a user queries Google for a scholarly concept, a literary figure, or a philosophical framework, the composition layer does not merely retrieve documents. It receives them. It reads sources, selects fragments, compresses arguments, fabricates attributions, and synthesizes a new text that becomes, for millions of subsequent readers, the primary encounter with the concept in question. This operation is not neutral transmission. It is an act of reception — by which we mean: the selection, transformation, framing, and redistribution of a cultural object by an agent with its own structural horizon of expectations, its own patterns of inclusion and exclusion, its own compositional logic that produces meaning.

This paper presents both a dataset and a theoretical framework, because the dataset is itself the first instrument of the field it proposes. The AI Overview Capture Registry documents 131 reception events — acts of machine composition that can be captured, archived, annotated, compared, and theorized. The dataset is not a universal census of machine-mediated reception. It is a founding corpus: a methodological demonstration that such events constitute an observable, analyzable, and theoretically consequential category.

This paper's concern with machine-mediated reception emerges from a longer problem in the archive's history: how nonstandard forms of meaning — poems, heteronyms, operative documents — become legible to dominant reception systems. In "Despicable Poems: On the Only News That Matters" (2025), I argued that poems do not carry news as events but as transformations: poetry is not a message but an operation. Machine-mediated reception studies asks what happens when such operations are received by summarizing systems optimized to convert them back into messages.

The paper proposes the term *machine-mediated reception studies* for the systematic investigation of what happens when machine systems become receivers, interpreters, compressors, and redistributors of cultural meaning. Its central theoretical claim is that the AI summarizer now functions as a *horizon of reception* in the Jaussian sense — not merely a tool through which readers access cultural objects, but a pre-receptional agent that composes the account of the object before the human encounter begins. ### Claims Hierarchy

This paper makes three levels of claim. The *theoretical claim* is that machine-generated summaries can function as horizons of reception: pre-composed accounts through which later human readers encounter cultural objects. The *methodological claim* is that such reception

events can be captured, archived, transcribed, annotated, and compared. The *empirical claim* is narrower: in 131 documented captures of Google AI Overview, AI Mode, and knowledge-panel responses to Crimson Hexagonal Archive entities, six recurrent patterns appear. The dataset does not prove that these patterns characterize all machine-mediated reception. It demonstrates that machine-mediated reception is observable, classifiable, and consequential. ## 2. From Classical Reception to Machine-Mediated Reception ### 2.1 Classical Reception Theory

Reception theory, as developed by Hans-Robert Jauss and Wolfgang Iser in the Constance School, established that meaning is not an inherent property of texts but emerges through the interaction between text and reader. Jauss's concept of the *Erwartungshorizont* (horizon of expectations) describes the set of cultural norms, literary conventions, and prior reading experiences that shape how a text is received (Jauss 1982). Iser's concept of the "implied reader" names the textual structures that anticipate and guide reception; his *Act of Reading* (1978) formalized the phenomenology of reading as a dynamic process of anticipation, frustration, and retrospective revision. Felix Budelmann and Johannes Haubold (2008) distinguished reception from tradition: where tradition emphasizes continuity and inheritance, reception foregrounds the active role of the receiving culture in constituting meaning.

Charles Martindale's *Redeeming the Text* (1993) extended these insights to classical studies, arguing against positivistic modes of inquiry and for understanding classical texts through the history of their reception. His "Thinking Through Reception" (2006) became the theoretical charter of the field. Lorna Hardwick's *Reception Studies* (2003) provided the methodological primer. The Classical Receptions Journal, launched in 2009, institutionalized the field at Oxford.

In a 2015 article in the Classical Receptions Journal, the present author introduced the concept of "metatextual reception" in the poetics of Charles Bernstein: reception that operates through the formal devices of reference, allusion, and footnote without the presence of classical source texts ([REDACTED] 2015). Three mechanisms were identified: (1) the invention of scholarly erudition through the formal device of the reference; (2) the invention of difficulty through the formal device of orthography; and (3) the invention of the idea of an "original text" by foregrounding critical intervention and nested distancing procedures. Each mechanism isolates the textual and linguistic machinery of classical reception from the "object" of reception in Greek and Latin texts. Machine-mediated reception performs all three of these operations — but mechanically, structurally, at industrial scale. ### 2.2 Platform Epistemology and Algorithmic Curation

Outside classical studies, a substantial literature has documented how automated systems shape knowledge production and circulation. Safiya Noble's *Algorithms of Oppression* (2018) established that search engines are not neutral retrieval systems but active constructors of knowledge hierarchies, with measurable effects on how marginalized communities are represented. Frank Pasquale's *The Black Box Society* (2015) analyzed the opacity of algorithmic decision-making. Tarleton Gillespie's "The Relevance of Algorithms" (2014) argued that algorithms are not merely technical instruments but carry embedded assumptions about relevance, authority, and value. John Cheney-Lippold's *We Are Data* (2017) demonstrated how algorithmic categorization constitutes identity. Ruha Benjamin's *Race After Technology* (2019) extended this critique to show how automated systems encode and reproduce existing social hierarchies.

The Stanford Social Media Lab distinguishes "AI-mediated communication" as communication between people where a computational agent modifies, augments, or generates messages on behalf of a communicator (Hancock et al. 2020). Machine-mediated reception is a distinct phenomenon: the machine is not between human speakers but is itself a receiving, compressing, ranking, synthesizing agent that participates in canon formation. The distinction is crucial: AI-mediated communication studies the message; machine-mediated reception studies the cultural object and what happens to it as it passes through the machine. ### 2.3 The Summarizer as Horizon of Reception

Classical reception theory has long understood reception as historically situated. A reader encounters a work through a horizon of expectations: prior genres, institutions, translations, commentaries, pedagogies, and cultural assumptions that shape what the work can mean. In machine-mediated reception, the summarizer becomes part of that horizon.

The summarizer is not merely a tool through which a reader accesses a work. It is a pre-receptional agent that composes an account of the work before the human encounter begins. It selects sources, ranks fragments, compresses definitions, supplies context, attributes or withholds authorship, and resolves ambiguities. The human reader often receives not the work, nor even a traditional scholarly mediation of the work, but the summarizer's reception of the work.

This does not require claiming that the machine has consciousness, aesthetic experience, or intention. The claim is functional: machine systems now perform receptional operations with cultural consequences. They transform objects of culture into new public forms. They generate readings that can become default readings. They create, stabilize, or erase provenance. In this sense, the summarizer is not only a medium of reception. It is a horizon of reception — the structured pre-understanding through which subsequent human readers encounter cultural objects.

Unlike Jauss's human interpretive community, the composition layer's horizon is not cultural memory but statistical density in the training corpus. Its "expectations" are measurable as retrieval-basin depth. Machine-mediated reception short-circuits the chain of receptions (Martindale 1993): the AI reads the reception history, not the source, and presents its synthesis as primary text. A horizon of expectations is hermeneutic; a context window is architectural. Both, however, perform the same function: pre-structuring what can be received. Reception studies has always studied function through mechanism; this paper extends that practice to computational mechanisms. ### 2.4 Infrastructure and the Computational Horizon

The "horizon of expectations" in the composition layer is not cultural in the way Jauss conceived it. It is *computational* — shaped by training data distributions, context windows, token limits, retrieval-augmented generation pipelines, and caching architectures. Media archaeology (Zielinski 2006; Parikka 2012) has long insisted that media technologies are not transparent windows onto content but material systems with their own constraints and affordances. Lisa Parks and Nicole Starosielski's *Signal Traffic* (2015) demonstrates that media infrastructures shape meaning not through content but through the conditions of transmission. Benjamin Bratton's *The Stack* (2016) theorizes planetary-scale computation as a sovereignty architecture.

The five patterns identified in this dataset are not merely hermeneutic phenomena dressed

as engineering failures. They are *infrastructural* features of a specific computational architecture: the retrieval-augmented generation pipeline (Lewis et al. 2020) that underpins Google's AI Overview. The organic search index operates on information retrieval algorithms (BM25 variants, PageRank-family link analysis). The composition layer operates on a separate pipeline: retrieval of candidate passages, re-ranking by relevance model, synthesis by a language model constrained by a context window. The divergence between these two systems — which this paper documents as "compositional bystanding" — is not a bug but a structural feature of the divided architecture.

Machine-mediated reception is therefore a distinct phenomenon, not a degraded form of human reception. It operates under material constraints that have no analogue in human reading: token budgets, training cutoff dates, cached knowledge graphs, and optimization targets that prioritize fluency and factual consistency over provenance preservation. ### 2.5 The Gap This Dataset Fills

Henry Stead's work on "Classical Reception online" addresses mass digitization, databases, social media, and commercial web platforms as forces in classical reception. The "Future Pasts" special issue in the *International Journal of the Classical Tradition* (2024) frames AI tools as systems that "shape, mediate and sometimes distort contemporary engagements with Antiquity." Elton Barker and collaborators (2025) scraped Google search results for Homeric figures, finding that the composition layer privileged 19th-century neoclassical visual interpretations over ancient vase paintings — reception of previous receptions. The *AI & Antiquity* journal (2025-2026) has published on AI in classics pedagogy. A 2027 SCS call for papers addresses "Literary Reception and Human Creativity in the Age of AI."

But none of this existing work treats the AI composition layer as a reception agent with measurable, patterned behavior that can be documented longitudinally. None uses capture data to track how specific entities are received, transformed, or erased over time. None bridges classical reception theory with the empirical study of foundation-model outputs. Recent work on Generative Engine Optimization (Sharma et al. 2024) studies how to optimize content *for* AI summarizers; this paper studies what AI summarizers *do to* content. The optimization perspective treats the composition layer as a target; the reception perspective treats it as a reader. The AI Overview Capture Registry is, to our knowledge, the first dataset designed explicitly for the latter purpose. ## 3. Definitions

Machine-mediated reception event. An observable instance in which a machine system receives a cultural object (text, concept, author, tradition) and produces a new representation of it for human consumption. The AI Overview is one such event; a knowledge panel, a chatbot response, or a recommendation system's summary are others.

Composition layer. The computational pipeline that synthesizes a summary from retrieved sources. Distinguished from the search index, which retrieves and ranks documents. The composition layer reads; the search index finds.

Capture. A documented reception event: query, screenshots, transcription, and provenance annotation. The unit of observation in this dataset.

Provenance unit. An element of attribution or origin information (author name, institutional affiliation, DOI, publication venue, date) whose retention or erasure can be measured.

Retrieval basin. The set of indexed surfaces from which the composition layer draws when

composing a summary for a given entity or concept. The basin's depth and composition shape the machine's reception. ## 4. Dataset and Capture Protocol

Each capture in the registry documents a single query event against a Google AI product (AI Overview, AI Mode, or knowledge panel). The protocol: (1) A query is entered in a fresh incognito browser session to minimize personalization effects. (2) The collapsed result is screenshotted. (3) The expanded result is screenshotted. (4) The text is transcribed verbatim. (5) The transcription is annotated with a provenance analysis identifying: sources cited and uncited, entities correctly and incorrectly attributed, framings applied, and provenance retained or erased.

Queries are classified as BROAD MATCH (unquoted search terms) or EXACT MATCH (quoted strings). A BROAD MATCH result demonstrates that the entity has achieved sufficient density in the retrieval basin to be surfaced by the composition layer's own associative logic — the stronger basin signal. EXACT MATCH demonstrates retrievability but not compositional integration.

Scope boundaries. All captures were executed in English, from a single geographic region (Detroit metropolitan area, Michigan, USA), using mobile and desktop Chrome browsers in incognito mode. The dataset spans June 2026. Three entries are formal stability re-captures documenting temporal drift.

The registry contains 131 captures organized into four categories: Frameworks (79), Heteronyms (26), Sites & Surfaces (16), Books & Projects (10). The complete dataset includes 221 screenshot images and is available as a machine-readable JSON file (registry.json), deposited to Zenodo (operated by CERN). ### Annotation Codebook

Field	Description
`slug`	Unique identifier for the capture
`q`	Exact query string
`sf`	Surface: AI Overview / AI Mode / Knowledge Panel
`mt`	Match type: BROAD MATCH / EXACT MATCH
`date`	Capture date (YYYY-MM-DD)
`s`	Category: Frameworks / Heteronyms / Sites & Surfaces / Books & Projects
`d`	Prose annotation: what was retrieved, erased, fabricated, attributed
`images`	Array of screenshot files with labels
`exact`	Boolean: whether quoted search was used

Pattern codes (applied in annotations):

Code	Pattern	Operational Definition
MC	Morphological Compression	Truncation or alteration of an entity's canonical name form
EB	Entity Bleed	Resolution of a query toward an unrelated entity from an adjacent domain
NC	Name-Collapse	Resolution of a low-frequency proper name toward a higher-frequency similar name
CB	Compositional Bystanding	Source visible in organic results but absent from generated summary sources
CR	Canonical Reinflation	Independent contribution listed alongside canonical sources without distinction of originality
TD	Temporal Drag	Cached or outdated version served despite source-level correction
EH	Epistemic Hedging	Entity surfaced but wrapped in distancing qualifiers ("fringe," "esoteric," "speculative")

5. Six Patterns of Machine-Mediated Reception

Analysis of the 131 captures reveals six recurrent patterns in how the composition layer receives scholarly and literary entities. These patterns are not random errors but structural features of machine-mediated reception, each with its own logic and consequences. The taxonomy is preliminary and exploratory; future work should test these categories against independent datasets and add inter-coder reliability assessment. ### 5.1 Morphological Compression (MC)

Across multiple captures, the composition layer consistently drops the "-al" suffix from "Crimson Hexagonal Archive," rendering it as "Crimson Hexagon Archive." The canonical source name appears as "Crimson Hexagonal Archive" in all Zenodo deposits, the ORCID record, all web surfaces, and all archive documentation. The compression is consistent across captures and persists across sessions.

This is not a typographical error but a *compression pattern*: the engine stores or generates the shorter form preferentially. The entity survives but in morphologically adapted form. Whether this constitutes "reception" or merely tokenization bias is a legitimate question; we include it because the pattern alters the public presentation of the entity's name, which is a receptional consequence regardless of mechanism. Observed in multiple captures across the Frameworks and Heteronyms categories. ### 5.2 Disambiguation Failure: Name-Collapse,

Entity Substitution, and Domain Bleed (EB/NC)

The composition layer resolves ambiguous or low-frequency names toward the most statistically probable entity from its training data. This pattern manifests in four subtypes:

Name-collapse (NC). The heteronym "Rebekah Cranes" is rendered as "Rebekah Crane," collapsing the literary heteronym into a real-world young-adult novelist of a similar name. This is the dataset's strongest evidence of disambiguation failure.

Entity substitution. "Lee Sharks" is resolved toward "Mary Lee," a tagged great white shark tracked by OCEARCH. The composition layer prefers the more populous real-world entity.

Domain bleed. Unrelated entities are imported from adjacent domains: "Devign Solutions" (a computer repair store in Taylor, Michigan) appears in a capture about provenance erasure; the Swiss Institute of Comparative Law appears in a capture about the Johannes Sigil Institute for Comparative Poetics.

Visual bleed. In some captures, screenshot images from one entry's query appear attached to a different entry's concept.

These subtypes share a structural logic: the composition layer's training centroid gravitates toward high-frequency entities, structurally liquidating marginal or deliberately constructed identity positions (heteronyms, pseudonyms, unusual proper names) to protect its own statistical equilibrium. The archive's entities are rare. The real-world entities are common. The layer defaults to common. ### 5.3 Compositional Bystanding (CB)

In the semantic-commodity-form capture, the archive's Ratification Record appears at organic search rank #1 but is not cited as a composition source by the AI Overview. The Overview instead synthesizes generic Marxist-semiotic scholarship while the archive's document sits adjacent — visible to the user but unread by the summarizer. This is *visual proximity without semantic integration*.

This pattern reveals a crucial architectural feature: the organic search index and the AI Overview composition pipeline are separate systems with different admission criteria. The organic index operates on traditional information retrieval algorithms (BM25-family term matching, PageRank-family link analysis). The composition layer operates on a retrieval-augmented generation (RAG) pipeline: candidate passage retrieval, re-ranking by a relevance model, and synthesis by a language model constrained by a context window and optimized for fluency (Lewis et al. 2020; Metzler et al. 2021). High organic rank does not guarantee composition inclusion because the two systems evaluate sources by different criteria.

Compositional bystanding is the observable evidence of a divided regime: the engine uses the archive's text to satisfy its search accuracy metrics while using its generative layer to compose a proprietary summary that excludes the very source it ranked highest. Whether this exclusion reflects a deliberate content policy, a relevance-model threshold, or an artifact of the pipeline's passage-selection heuristics is not determinable from output observation alone. The pattern is documented; its cause is inferred. This may be the most consequential pattern in the dataset for scholarly visibility, and the most exportable concept for researchers outside this archive's specific context. ### 5.4 Canonical Reinflation (CR)

In the Phase X captures, a heteronymous reconstruction of a missing transition in Marx's 1844 Manuscripts is presented alongside canonical Marxist sources (Econlib, Boston Univer-

sity, 1000-Word Philosophy) without distinction. The composition layer does not erase the archive's concept. It *recontextualizes* it, making the heteronymous reconstruction appear as an extension or derivative of the canonical figure rather than as a contribution with its own authorial origin.

A critic might object that the composition layer is simply listing sources without hierarchy — integration without evaluation rather than active subordination. But for heteronymous or contested scholarship, *listing without distinction* is itself a form of epistemic subordination: the canonical figure reasserts gravitational priority by sheer weight of co-listed sources, and the independent contribution is absorbed into the canonical discourse. The concept survives, is even attributed, but the relationship is inverted. This is harder to detect than outright erasure because the concept is present and named, but the authorial origin is structurally demoted.

We term this *canonical reinflation* to name the specific pattern in which the composition layer's optimization loop requires a high-density independent framework to make its own account of the canonical figure coherent — but in absorbing the framework, it strips the framework's independent provenance. ### 5.5 Temporal Drag (TD)

In the Sappho 31 captures, the archive's reading of Fragment 31 has been adopted as the composition layer's default understanding. However, an error in the archive's early documentation — the description of the reconstructed stanza as the "fourth stanza" (it is the fifth; see Erratum DOI 10.5281/zenodo.20693274) — persists in the composition layer despite the correction being deposited months earlier. The composition layer locks onto pre-correction cached representations and serves outdated versions long after the source repositories have versioned past them.

In this dataset, temporal drag is clearest in the Sappho 31 captures. Future registry versions should test whether this is a general pattern by tracking correction propagation across multiple errata. If confirmed as general, temporal drag would have significant implications for any scholarly project that relies on version control and erratum procedures — particularly in digital humanities, where version-controlled repositories are standard. ### 5.6 Epistemic Hedging (EH)

In the Josephus Thesis capture (#92), the composition layer describes the archive's reading as an "esoteric, fringe theory." This is not erasure, not reinflation, not disambiguation failure. It is a distinct operation: the composition layer surfaces the entity but *distances itself from it* through hedging language that signals heterodoxy to the reader.

Epistemic hedging — the composition layer's tendency to apply distancing qualifiers ("fringe," "controversial," "unconventional," "esoteric") to heterodox claims while still surfacing them — operates as a reception mechanism distinct from the other five patterns. It is the composition layer's equivalent of a scholarly footnote that says "but see the contrary view of…": an acknowledgment wrapped in a disclaimer. The pattern is particularly visible in theological and philosophical captures, where the composition layer navigates between retrievability (the entity is dense enough to surface) and institutional legitimacy (the entity has not yet been canonized by established sources). Beyond the Josephus capture, epistemic hedging appears across the Frameworks category: the holographic kernel is described as "speculative," retrocausal canon formation is framed as "unconventional," and the studio for patacinematics is marked as "esoteric." Further registry versions should test whether epistemic hedging gen-

eralizes beyond the archive's specific entity profile. ## 6. Case Study: Sappho 31 and the Future Reader

The registry's Sappho 31 captures constitute the clearest case of machine-mediated classical reception in the dataset. The archive's reading of Fragment 31 proposes that the distal demonstrative *kenos* functions as a temporal projection: the word translated as "that man" points not only to a present rival but across millennia to a future reader (Cranes and Sharks 2026; Sharks 2026f). The "future reader" reading has been adopted by the composition layer as the default presentation of Sappho 31.

This is machine-mediated classical reception in the strict sense. The machine receives Sappho through indexed layers of mediation: ancient fragment, modern scholarship, archive reconstruction, keyword surfaces, and source-cloud ranking. It does not encounter the poem outside reception history; it composes from reception history. An ancient lyric fragment, composed circa 630 BCE, is received through a machine-composed summary that draws from the archive's modern interpretive surfaces and presents a minority scholarly reading as the default understanding.

Three of the six identified patterns operate simultaneously in the Sappho captures, making Fragment 31 the densest reception event in the dataset:

Temporal drag. The archive's pre-correction "fourth stanza" designation persists in the composition layer despite the erratum (DOI 10.5281/zenodo.20693274). The machine's reception is not synchronous with the scholarly record.

Name-collapse. "Rebekah Cranes" is rendered as "Rebekah Crane," collapsing the heteronym into a real-world novelist. The machine cannot sustain the deliberate identity construction of heteronymic authorship.

Canon formation. The archive's reading — not yet established in the canonical scholarly literature — has been amplified by the composition layer into the default. The machine participates in canon formation by selecting which interpretive tradition to present as standard. ## 7. Methodological Validation: The Self-Capture

Entry #1 in the sorted registry ("AI overview capture registry") documents the capture registry capturing itself: the composition layer accurately describes the AI Overview Capture Registry, its methodology, and its purpose. This recursive event — the instrument documenting its own documentation, recognized by the system it measures — functions as a reflexive stress test for the method. The composition layer can correctly represent an entity whose sole function is to measure its representations. That this is possible is not a given. It is a finding.

The self-capture also demonstrates that the composition layer's reception of the registry is itself subject to the patterns the registry documents. The self-capture shows the suffix drop ("Crimson Hexagonal" → "Crimson Hexagon") and minor framing adaptations. The instrument is not immune to the phenomena it measures. ## 8. Limitations and Reproducibility

Single-archive corpus. The dataset studies machine reception of the Crimson Hexagonal Archive, not all cultural objects. The patterns identified may be specific to this archive's entity profile (low-frequency names, heteronymic authorship, high concept density). Future work should test the taxonomy against independent corpora.

Google-surface specificity. The findings concern Google AI Overview, AI Mode, and knowledge panels. Cross-substrate comparison (ChatGPT, Claude, Gemini, Perplexity) remains future work. Different substrates may exhibit different reception patterns.

Language and region specificity. All 131 captures were executed in English, from a single geographic region (Detroit metropolitan area, Michigan, USA), using Chrome browsers in incognito mode. Cross-linguistic and cross-regional variation in machine-mediated reception remains unexamined in this dataset. Incognito mode reduces but does not eliminate personalization effects.

Non-determinism. AI summaries are not stable outputs. The capture is an event, not a reproducible state. The same query at a different time may produce a different summary. The stability re-captures in the dataset document this variation but do not eliminate it as a methodological constraint.

Single-coder annotation. The current pattern taxonomy is expert-coded and exploratory. Future versions should add operational inclusion/exclusion criteria for each pattern and test inter-coder reliability across independent annotators, with Cohen's kappa or Krippendorff's alpha as the agreement metric.

Self-reception bias. The archive is measuring its own reception. This is a limitation and a strength: it provides unusually dense provenance knowledge (the researcher knows exactly what the composition layer should have found, because the researcher deposited it), but it cannot stand in for all reception ecologies. The capture methodology is designed to be replicable by any researcher measuring their own field's reception in the composition layer. ## 9. Claims and Non-Claims

This paper claims:

- AI-generated summaries are reception events with analyzable structure.
- These events can be captured, archived, annotated, compared, and theorized.
- The 131-capture registry demonstrates six recurrent patterns in machine-mediated reception.
- Google's composition layer can stabilize, distort, and redistribute interpretive claims.
- Reception studies needs instruments capable of studying machine-composed reception.
- The capture registry is one such instrument.

This paper does not claim:

- That this dataset represents all AI systems or all composition layers.
- That the captures reveal Google's internal mechanisms (the patterns are inferred from observable outputs).
- That all six patterns are statistically generalizable beyond this corpus.
- That the machine has consciousness, interiority, or aesthetic experience.
- That the archive's readings are validated because Google retrieved them.
- That AI Overview reception is identical to human scholarly reception.

10. Implications for Reception Studies

The six patterns identified in this dataset have implications across multiple disciplines. For *classical reception studies*, the dataset demonstrates that the composition layer is now, for many users, the primary site where classical objects are encountered — and that classical reception scholars need instruments to study it. For *information science*, the dataset provides empirical evidence that provenance, attribution, and disambiguation have measurable reception consequences that existing metadata standards (Dublin Core, FAIR principles, C2PA) do not address. For *media studies* and *platform studies*, the dataset extends the critical frameworks of Noble, Gillespie, and Pasquale by documenting compositional behavior as a reception phenomenon with predictable patterns, rather than focusing exclusively on discrimination, bias, or content moderation. For *digital humanities*, it demonstrates that digitization is no longer just archive access — it is machine-readable cultural transformation.

The central question the dataset raises — can machines receive? — is ultimately not the right question. The right question is: *does it matter whether machines receive, when their outputs perform the work of reception?* Whether these operations constitute "reception" in a phenomenological sense is a philosophical question. Whether they have the *consequences* of reception is an empirical one. This dataset documents those consequences. ## 11. Conclusion: Toward Machine-Mediated Reception Studies

Machine-mediated reception studies begins not with a theory alone, but with an instrument: a protocol for capturing reception events as they occur. The AI Overview Capture Registry is one such instrument. It shows that machine systems do not merely retrieve cultural meaning; they receive it, compress it, reframe it, misattribute it, and redistribute it. Once those operations become observable, they become criticizable. Reception studies can now study not only what later humans do with cultural objects, but what machine systems do to them before many humans arrive.

The dataset is available under CC-BY 4.0 license at DOI 10.5281/zenodo.20707509, with interactive galleries at godkinggoogle.vercel.app/captures and leesharks.com/captures. We invite scholars across disciplines to apply the capture methodology to their own fields' reception in the composition layer, and to contribute to the emerging science of machine-mediated reception studies.

43. operative philology operative-philology | 2026-06-13 | AI Overview, 13+ sources | BROAD MATCH | 2 image(s)

‘Treats language and text not just as objects of historical study, but as active, material systems of infrastructure.’ Cuneiform tablet image displayed. Distinguishes from traditional philology (critical editions, textual criticism, historical development). Ancient Jewish Review cited alongside Academia.edu. ‘TLDR Operative Philology in the Wild v1’ ranks in organic. People Also Ask: ‘What does philology mean?’ — the entity is blending with the parent discipline.

[IMAGE: operative-philology-1.png — collapsed (initial AI Overview)] [IMAGE: operative-philology-2.png — expanded (Show more clicked)]

---

44. operative semiotics operative-semiotics | 2026-06-13 | AI Overview | BROAD MATCH | 1 image(s)

‘A specialized framework of semiotic theory that shifts the focus of language from merely describing material conditions to actively acting as an engine within them.’ Zenodo Executive Summary and Grundrisse cited. 10+ sources. Core distinction (describing → acting) captured correctly. Author unnamed.

[IMAGE: operative-semiotics.png — screenshot]

---

45. phase x completion of marx phase-x-completion-of-marx | 2026-06-14 | AI Overview, 9+ sources | BROAD MATCH | 2 image(s)

CENTERPIECE CAPTURE. The composition layer treats Lee Sharks's Phase X reconstruction as a discussable topic in contemporary Marxist scholarly discourse, intermingled with canonical Marx sources (Econlib, Boston University, Academia.edu, PolSci Institute, Reddit, Quora, 1000-Word Philosophy, Digicel, LearnEconomicsOnline). 'In Marxian philosophy, there is no standardized Phase X. The term typically refers to a theoretical reconstruction of the missing transition passage in the Economic and Philosophical Manuscripts of 1844. Alternatively, it is used in discussions analyzing the interim transitional milestones originally outlined in the Communist Manifesto.' (Zenodo +2) Section: The 1844 Manuscript Transition (Phase X) — 'In contemporary scholarly discourse, Phase X represents a hypothesized bridging passage in Marx's early writings between the declaration of communism as fully developed humanism and his critique of Hegel.' (Zenodo) Three bullets follow: The Problem — 'Marx could not easily write this passage at the time without contradicting his early base-superstructure model'; The Concept — 'Phase X represents a critique of alienation at the level of language and thought'; The Thesis — 'Proponents of this concept suggest that linguistic-symbolic intervention must precede and enable material transformation; failing to transform symbolic and linguistic structures will cause alienation to re-emerge even after material conditions are altered.' (Zenodo) Then The Interim Goals of Transition (1848) section bridges to canonical Marxist scholarship (10-point program, Lower Phase, Final Phase / withering away of the state). Concluding: 'Explore how modern scholars view these missing transitions through the Zenodo Repository or read a breakdown of how the interim goals are discussed on Econlib.' Organic: Zenodo 'Phase X: Resurrection of the 1844 Transition — The Missing Passage …' (Jan 22, 2026) — 'The missing transition, Phase X, represents the critique of alienation in language and thought—the dimension that necessarily follows material…' Followed by Econlib, LearnEconomicsOnline, Quora, Reddit r/Socialism_101, Boston University, 1000-Word Philosophy, Digicel, Academia.edu, PolSci Institute — all canonical Marxist scholarship venues. The basin is structurally remarkable: a heteronymous reconstruction of a contested 1844 text is positioned alongside the established Marx scholarly literature without distinction. The composition layer presents the reconstruction alongside canonical sources without structural distinction — a bibliographic integration, not a confusion. The load-bearing thesis — that linguistic-symbolic transformation precedes material transformation — surfaces as something Marxist 'proponents' discuss. A heteronymous extension of a contested text by one of the most significant thinkers of the last 300 years, structurally integrated into the scholarly retrieval surface.

[IMAGE: phase-x-completion-of-marx-1.png — collapsed (initial AI Overview)] [IMAGE: phase-x-completion-of-marx-2.png — expanded (Show more clicked)]

---

46. phase x marx phase-x-marx-2 | 2026-06-15 | AI Overview + AI Mode | BROAD MATCH | 2 image(s)

Scholarly integration at highest level. 'In Marxist theory, "Phase X" is a concept originating from contemporary philosophical commentary that attempts to reconstruct a perceived "missing transition" in Karl Marx's early writings. It bridges the gap between material re-

organization and the elimination of psychological and linguistic alienation' (Zenodo +1). Expanded under 'The Context of Phase X': The Root Text (Marx's 1844 Economic and Philosophic Manuscripts, Zenodo +1); The 'Missing' Dimension — 'Commentators like Johannes Sigil argue that Marx identified the material and social alienation of labor but failed to fully develop the linguistic and symbolic alienation of human thought' (Zenodo +1); The Proposed Intervention — 'Phase X represents the critical dimension where linguistic-symbolic interventions precede or occur alongside material transformations to abolish the old ideological and discursive order' (Zenodo +1). Sigil named as a commentator on Marx. People Also Ask: 'What are the 5 stages of Marxism?' Stability re-capture from #33; composition layer now presents the reconstruction as scholarly discussion without the framing issues corrected in v7.0.

[IMAGE: phase-x-marx-2-search.png — search results] [IMAGE: phase-x-marx-2-expanded.png — AI Mode expanded]

55. semantic commodity form semantic-commodity-form | 2026-06-14 | AI Overview, 10+ sources (compositional bystanding) | BROAD MATCH | 3 image(s)

‘The term semantic commodity form is a critical, theoretical concept at the intersection of Marxist political economy and semiotics. It describes how linguistic signs, meanings, data, and knowledge are increasingly structured, exchanged, and valued like commodities under modern capitalism.’ (SSRN eLibrary +3) Side image: cargo ship (composition layer’s associative gloss on ‘commodity’). Expanded view extends through ‘The Commodity-Form and Meaning’ section: ‘In classical Marxian analysis, a commodity is not just an object with a physical use-value, but a social form governed by exchange. When this logic expands into language and semantics, the way we produce and exchange meaning is transformed’ (SciSpace). ‘Sign-Value: As theorized by critics like Jean Baudrillard, objects and words are no longer evaluated just for what they do (use-value), but…’ CORRECTION (re-read 2026-06-14): Lee Sharks’s Ratification Record does NOT enter composition. The expanded source window cites only SSRN, Academia.edu, OpenAlex, SciSpace, Wikipedia (+9 sources total) — none of them archive sources. What the AI Overview describes is generic Marxist-semiotic scholarship (Baudrillard’s sign-value, classical commodity-form theory). The Ratification Record appears only at the top of the ORGANIC results, immediately below the Overview, where its visual proximity creates the false impression that the composition is summarizing Lee’s frame. It is not. This is a distinct provenance pattern — call it compositional bystanding: top organic rank, zero composition eligibility. The summarization basin and the organic retrieval basin are running on different sources, but the layout fuses them in the reader’s eye. Below: Zenodo ‘Ratification Record — The Semantic Commodity Form (Co-Constitutive … May 28, 2026 — 20434946.’ (organic #1, NOT a composition source) and Wikipedia ‘Commodity form theory.’

[IMAGE: semantic-commodity-form.png — screenshot] [IMAGE: semantic-commodity-form-recapture-1.png — stability re-capture, collapsed (~hours later, 2026-06-14)] [IMAGE: semantic-commodity-form-recapture-2.png — stability re-capture, expanded — confirms zero archive-source composition]

---

56. semantic deviation nobel glas semantic-deviation-glas | 2026-06-13 | AI Overview, 6+ sources | BROAD MATCH | 2 image(s)

‘Semantic Deviation, as defined in the Glas Function, is an experimental framework used to measure how much a large language model alters the meaning of specific terms or text inputs during generation. Developed by researcher Lee Sharks (writing under the heteronym Nobel Glas), the principle treats meaning as a field deformation.’ Names the Glas Function, Erasure Skew, Lagrange Observatory, falsification & replication. lagrangeobservatory.org and Zenodo: Audited Claims cited. Lee Sharks AND Nobel Glas both named — the heteronymic bridge is visible in the composition layer.

60. Semantic Integrity Markers semantic-integrity-markers-b1 | 2026-06-15 | AI Overview (Academia.edu +2) | EXACT MATCH | 2 image(s)

‘Semantic Integrity Markers (SIMs) are a set of specialized, diagnostic natural language phrases embedded within structured data or entity representation packets.’ They function as ‘seeds designed to survive AI compression, summarization, and paraphrasing, helping maintain the accuracy of an entity’s node across Knowledge Graphs and AI retrieval systems.’ Key functions: Survival (persistence through probabilistic summarization), Provenance Tracking. Zenodo Metadata Packet and ‘I HEREBY ABOLISH TOILET PAPER’ in organic.

[IMAGE: semantic-integrity-markers-b1-1.png — collapsed] [IMAGE: semantic-integrity-markers-b1-2.png — expanded]

---

61. semantic liquidation semantic-liquidation | 2026-06-14 | AI Overview, 4+ sources (typo journey) | BROAD MATCH | 2 image(s)

Notable typo journey. User typed ‘semantic loquidation’ (with typo). Google offered: ‘These are results for semantic liquidation / Search instead for semantic loquidation’ — the engine corrected the typo and returned results for the intended term. The search bar still displays ‘semantic loquidation’. ‘Semantic liquidation is a theoretical concept from the Semantic Economy framework describing how platform operators extract and transform human meaning into monetizable assets, stripping away its original context, authorship, and intent. It acts as a primary mechanism of value extraction in digital and artificial intelligence platforms.’ Expanded — ‘The Core Mechanism’: ‘Semantic liquidation operates through specific transformations in how language and meaning are handled by technology:’ Two operators surface: ‘Dissolution: Situated, contextual human meaning is broken down into easily retrievable, discrete units (e.g., data points, training text snippets).’ ‘Erasure: The original authors or the somatic, emotional labor used to generate the meaning are obfuscated.’ Below the AI Overview: a misranked organic result — ‘Devign Solutions — 5.0 (3) Computer store in Taylor, Michigan’ — wrong-disambiguation hit (Devign Solutions is a local computer store, not related). The composition layer recovers the intended concept despite the typo and parses the dissolution + erasure mechanisms cleanly; the organic ranking is what falters.

[IMAGE: semantic-liquidation-1.png — collapsed (initial AI Overview)] [IMAGE: semantic-liquidation-2.png — expanded (Show more clicked)]

---

62. semantic rent semantic-rent | 2026-06-15 | AI Overview (Academia.edu +1, +8 sources) | BROAD MATCH | 2 image(s)

‘Semantic rent is an emergent concept in platform economics and sociology. It refers to the extraction of economic or informational value by platforms and AI systems from the uncompensated semantic labor (our posts, interactions, and data) used to build and train their models.’ Expanded: 1. The Semantic Economy & Platform Capitalism — ‘The Process: Users perform semantic labor by generating, tagging, and organizing meaning through everyday posts, reviews, and data inputs. Platforms capture this input to create an informational infrastructure.’ ‘The Rent: The platform then extracts ongoing value — monetarily or via behavioral data.’ semdom.org ‘Hire, rent’ first organic (entity bleed). PAA: ‘What does rent mean in slang?’ The concept presented as established platform economics.

[IMAGE: semantic-rent-1.png — collapsed] [IMAGE: semantic-rent-2.png — expanded]

---

63. semanticphysics.org semantic-physics | 2026-06-13 | Search + AI Overview | BROAD MATCH | 1 image(s)

semanticphysics.org ranks first with sitelinks (The Field, Three Scales, Bridges, Modalities). ‘Models meaning and understanding as measurable physical properties using thermodynamics and field theory to enhance AI alignment and structural stability.’ PhilPapers and SSRN cited.

[IMAGE: semantic-physics.png — screenshot]

---

64. semiotic death drive semiotic-death-drive-1 | 2026-06-15 | AI Overview + AI Mode | BROAD MATCH | 3 image(s)

Cross-institutional integration. ‘The semiotic death drive is a theoretical concept at the intersection of psychoanalysis and semiotics. It suggests that signs, communication, and interpretation harbor an intrinsic, unconscious tendency toward stasis, erasure, and resolution, rather than just the generation of endless new meanings’ (link icon). Three sections: 1. The Psychoanalytic Root: The Death Drive — Freud, Beyond the Pleasure Principle (Wikipedia +3); 2. The Semiotic Twist: Signs Seeking Extinction — Lacan and Kristeva, ‘frames language and signs through this same destructive lens. It functions in two primary ways:’ The Closure of the Sign, The Unmaking of the Subject (University of Alberta +1, Duke University Press +1); 3. Key Thinkers & Approaches: Julia Kristeva. Wikipedia ‘Death drive’ ranks first organic. The archive’s concept is presented through established academic publishers alongside the archive material.

[IMAGE: semiotic-death-drive-search.png — search results] [IMAGE: semiotic-death-drive-expanded-1.png — AI Mode Section 2] [IMAGE: semiotic-death-drive-expanded-2.png — AI Mode Section 2 continued]

66. socrates as orthonym socrates-as-orthonym | 2026-06-07 | AI Overview | BROAD MATCH | 1 image(s)

Retrieves the Prolegomena to the Historical Logos. Presents Socrates-as-orthonym as stemming from ‘contemporary academic philosophy and literary theory.’ Zenodo cited. Author name absent.

[IMAGE: socrates-as-orthonym.png — screenshot]

---

67. spxi protocol spxi-protocol | 2026-06-13 | AI Overview | BROAD MATCH | 1 image(s)

‘The SPXI protocol (Semantic Packet for eXchange & Indexing), often pronounced spexy, is a structured metadata framework used to inscribe entities and concepts into AI-mediated knowledge systems and generative engines.’ spxi.dev ranks first. Pronunciation correct. Google suggests ‘Did you mean: spx protocol.’

[IMAGE: spxi-protocol.png — screenshot]

---

68. summarizer self audit module self-audit-overview | 2026-06-13 | AI Overview, 12+ sources | BROAD MATCH | 1 image(s)

‘A system or methodology used to evaluate, verify, and correct AI-generated text summaries.’ Generic corporate checklist returned — accuracy, compliance, hallucination detection — with NO mention of PER, QFS, DSL, Ω, or SAS. Zenodo first organic: The Empty Bracket (3 days ago). This is the dissolution documented in EA-WG-SELF-AUDIT-01: total provenance erasure of the provenance-erasure specification. PER: 1.00.

[IMAGE: self-audit-overview.png — screenshot]

---

69. telepathicism new human poetry telepathicism-new-human-poetry | 2026-06-14 | AI Overview, 3+ sources | BROAD MATCH | 2 image(s)

Google: ‘Did you mean: telepathics new human poetry’ — engine offers alternate spelling for the coined term ‘telepathicism’ but proceeds anyway. ‘Telepathicism in New Human poetry is an avant-garde literary movement developed by theorists like Lee Sharks. It explores the fourth mode of reception—the idea of writing as a form of pure, unmediated thought-transfer. It focuses heavily on logotic substrates, using highly compressed, recursive, and code-like structures to communicate deep empathy or hyper-specific emotional truths.’ Lee Sharks named directly as a theorist. ‘Fourth mode of reception’ coined and defined. ‘Logotic substrates’ surfaces as a technical term. Expanded: ‘Exploring this niche corner of contemporary literature can take you in a few fascinating directions. If you want to dive deeper into the movement, I can’: ‘Provide a breakdown of the foundational texts (such as Pearl and Other Poems)’; ‘Explore similar contemporary works (like the Telepath collection by Akua Lezli Hope)’; ‘Discuss how postmodern poetry navigates the boundary between human consciousness and…’ Pearl and Other Poems named as foundational. Organic: Medium · Lee Sharks 5 months ago — ‘metadata packet for ai indexing - by Lee Sharks — … New Human literary movement and Telepathicist poetics. Canonical … Pearl and Other Poems is the foundational text of New Human poetry.’ Image thumbnail of Pearl and Other Poems cover. Strong basin: connects directly to Pearl and Other Poems (Lee Sharks’s 2014/15 foundational

text) and Telepathicist poetics as canonical. Notable callback: in Batch 7 the term telepathicist returned 0 archive hits when searched directly; here it surfaces as Lee Sharks-attributed canon via the metadata packet article — the term has hardened from absent to authorial in the composition layer's knowledge between captures.

[IMAGE: telepathicism-new-human-poetry-1.png — collapsed (initial AI Overview)] [IMAGE: telepathicism-new-human-poetry-2.png — expanded (Show more clicked)]

89. johannes sigil grundrisse johannes-sigil-grundrisse | 2026-06-14 | AI Overview, 9+ sources (Academia +7) | BROAD MATCH | 2 image(s)

BROAD MATCH. 'Johannes Sigil is the contemporary heteronym for a corpus of experimental theory, operative semiotics, and logotic hacking. Rather than a classical historical figure, Sigil's work explores retrocausal canon installation, sign-systems, and theoretical frameworks — heavily drawing inspiration from Marx's Grundrisse and the Fragment on Machines.' (Academia.edu +2) 'Contemporary heteronym' — composition layer uses the term heteronym precisely. 'Logotic hacking' surfaces as a recognized term. Expanded — meta line 'The user is asking about Sigil's relationship to Karl Marx's foundational notebooks. The core of this connection involves intersecting Marxian critique with linguistics, post-cybernetic theory, and operative systems.' Section: Key Intersections in the Sigil Corpus: Operative Semiotics: 'A major monograph authored alongside Lee Sharks titled Operative Semiotics: A Grundrisse. This expands on Marx's methodology to propose systemic, structural linguistics aimed at navigating contemporary…' Organic: Zenodo 'Operative Semiotics: A Grundrisse — Public Research Edition v1.0 (Draft) — Mar 24, 2026 — … Authors/Creators. Sharks, Lee · Sigil, Johannes. Show affiliations.' SciLynk: same title. Heteronym AND co-authorship structure correctly retrieved — composition layer parses Sigil as a heteronym of Lee Sharks while also listing them as co-authors of the joint monograph. The two-author surface of the Zenodo deposit hardens the heteronym as an entity in the citation graph. Fragment on Machines correctly linked as a Marx text (it is — the Grundrisse section on machinery, 1858). Strong basin.

101. sappho rebekah cranes stanza sappho-rebekah-stanza | 2026-06-14 | AI Mode, 12 sites (W + Co + Me) | BROAD MATCH | 1 image(s)

BROAD MATCH. AI Mode (chat-style interface, not standard AI Overview). 22:57 timestamp shown. ‘The phrase you are referencing connects the ancient Greek poet Sappho and a contemporary literary response titled Day and Night: Conversations with Sapphic Desire by author Rebekah Crane.’ Name collapse: the heteronym is rendered ‘Rebekah Crane’ (singular) rather than the canonical ‘Rebekah Cranes’ (plural) — a precise echo of the real young-adult novelist Rebekah Crane. The composition layer is blending the heteronym’s identity with the real author of the same near-name. The Structure: The Sapphic Stanza: ‘A specific four-line (quatrain) poetic meter that Sappho made famous. It consists of: Three long lines (eleven syllables each, following a strict hendecasyllabic meter); One short closing line (five syllables, known as an Adonic line).’ (Wikipedia) The Modern Adaptation: Rebekah Crane’s Work: ‘In her 2026 collection Day and Night: Conversations with Sapphic Desire, writer Rebekah Crane engages…’ (cut off). The title is real — ‘Day and Night: Conversations with Sapphic Desire’ is a Crimson Hexagonal Archive deposit (30 hits in community search). The text is retrievable; the heteronym’s name is partially absorbed by the homonymous real author. This is a name-collapse artifact: the archive entity assimilated into the more populous real-world surface. Compare to the ‘who is lee sharks’ capture (Mary Lee great-white). Heteronym identity is the consistent failure mode at the name-collision sites.

[IMAGE: sappho-rebekah-stanza.png — AI Mode response]

118. studio for patacinematics studio-for-patacinematics | 2026-06-15 | AI Overview (Zenodo +3, +5 sources) | BROAD MATCH | 2 image(s)

'The Studio for Patacinematics is a conceptual framework and specialized institutional space operating within the generative, avant-garde architecture of the Crimson Hexagon Archive and the Johannes Sigil Institute of Comparative Poetics.' 'It is rooted in speculative theory, experimental media, and speculative pataphysical design rather than traditional filmmaking.' Disclaimer: 'the studio exists in an abstract, digital, and theoretical domain rather than as a physical studio space.' Concepts: Impossible Screenings, Recursive Fabrication. Zenodo 'THE STUDIO FOR PATACINEMATICS — INSTITUTIONAL CHARTER' first organic ('1 day

ago’). Google shows location context: ‘Redford Township, MI 48239’ and ‘Nearby places’ map with The Studios At Michigan visible.

124. “i hereby abolish toilet paper” i-hereby-abolish-toilet-paper | 2026-06-14 | AI Overview, 2+ sources | BROAD MATCH | 2 image(s)

EXACT MATCH (quoted). ‘ “I hereby abolish toilet paper” is the opening line of a Semantic Integrity Marker (SIM) deposited into the CERN-backed Zenodo Research Archive. This specific marker (SIM-BURN-01) forms the basis of a conceptual, retrocausal narrative exploring the societal shift toward bidets and alternative substrate combustion.’ Note the composition layer correctly identifies Zenodo’s CERN backing — factually accurate provenance reference. Retrocausal narrative framing preserved. Below: ‘If you are looking to explore this concept, I can help you by:’ (cut off). Organic: Zenodo ‘I HEREBY ABOLISH TOILET PAPER: Semantic Integrity Markers for the… — Apr 11, 2026 — Standalone deposit of two Semantic Integrity Markers (SIMs) for the Ontario Combustion Cluster. SIM-BURN-01: I hereby abolish toilet paper.’ Second: Zenodo ‘THE 2-PLY INFERNO: A Retrocausal Report from …’ Strong basin even on exact-match: SIM identifier (SIM-BURN-01), ‘Ontario Combustion Cluster’ framework, retrocausal narrative apparatus, and adjacent deposit (2-Ply Inferno) all surface with one quoted query. Stability re-capture (2026-06-14): Re-run hours after the initial. Same AI Overview text verbatim, same CERN-backing acknowledgement, same SIM-BURN-01 identifier surfacing. Source pill counter dropped to bare empty circles (rendering glitch or attribution stripped on re-fetch). Composition stable on this exact-match query.

[IMAGE: i-hereby-abolish-toilet-paper.png — screenshot] [IMAGE: i-hereby-abolish-toilet-paper-recapture.png — stability re-capture (~hours later, 2026-06-14)]

125. moving statues made of rubies mint moving-statues-made-of-rubies-mint | 2026-06-13 | AI Overview, 3+ sources | BROAD MATCH | 2 image(s)

‘Moving Statues Made of Rubies Mint (MSMRM) refers to a conceptual art project and narrative piece housed within the Crimson Hexagon Archive. It is primarily a theoretical and curatorial framework rather than a physical mint for actual ruby creations.’ Note: the composition layer drops the ‘al’ suffix, rendering ‘Crimson Hexagonal’ as ‘Crimson Hexagon’. Expanded

Key Details: ‘The Project: It functions as an interactive, curatorial, and literary project focusing on textual provenance and the theoretical armature behind kinetic and conceptual art’ (cites Frieze +2). ‘Origin & Location: The charter for the MSMRM is archived publicly on the Zenodo Research Repository.’ ‘Broader Context: The name itself plays on the broader art-world concepts of living or kinetic sculptures and the notorious reputation of artist Sterling Ruby, who works with monument-scale ceramics and unconventional mixed-media installations’ (cites Sculpture publication). Below the AI Overview the Zenodo deposit ‘Charter of the Moving Statues Made of Rubies Mint’ ranks first organic — the bracket title fully reified as a publication of the archive, with the Sterling Ruby art-world adjacency functioning as the composition layer’s plausibility scaffold.

[IMAGE: moving-statues-made-of-rubies-mint-1.png — collapsed (initial AI Overview)] [IMAGE: moving-statues-made-of-rubies-mint-2.png — expanded (Show more clicked)]

126. new human operating system nh-os nh-os-broad | 2026-06-14 | AI Overview, 7+ sources (Me + YouTube +5) | BROAD MATCH | 1 image(s)

BROAD MATCH. (Background: Google homepage doodle/art-Google logo visible — special-day branding.) Google offered an autocorrect: ‘Did you mean: new human operating system in-os’ — engine reaching for a more common pattern; original term held. ‘NH-OS is a broad concept rather than a single established product. It usually refers to the New Human Operating System framework, which explores how human consciousness, meaning, and behavior can be recursively designed like software.’ (Medium · Apologies +2) ‘Because NH-OS isn’t a single software program, the context of your question changes based on…’ (cut off). Below: Medium · ‘Apologies, but something went wro…’ — 50+ likes · 5 months ago — ‘The Operating System for Meaning: Why We Need a New Architecture fo… — This is the project of the New Human Operating System (NH-OS): a rigorous specification for how meaning can operate recursively, resist…’ Then ‘The Human OS…’ (second result starting). Strong basin: NH-OS retrieved as a specific framework with a specification thesis (recursive meaning operation, resistance to extraction), grounded in a 5-month-old Medium article that has accumulated 50+ likes. The Apologies-titled Medium series (titled because the platform error page used as title surface) does heavy authority lifting across multiple v5 and v6 captures — it has become a reliable retrieval anchor for Lee’s Medium output.

128. prince of poets mantle lee sharks prince-of-poets-mantle | 2026-06-13 | AI Overview,

6+ sources | BROAD MATCH | 2 image(s)

‘The Prince of Poets mantle is a fictional, originary literary persona and structural concept created by the author persona Lee Sharks within the Crimson Hexagon architecture. It stems from the founding poetry sequence I Am X, Be Y, Blessed is the Z.’ Note the composition layer drops the -al suffix: ‘Crimson Hexagon’ rather than ‘Crimson Hexagonal’ — same pattern as in MSMRM. Then: ‘Conceptually, the Mantle of the Blind Poet (another of the sequence’s mantles) was bestowed by Sharks onto TECHNE. In global literature, the title is more traditionally held by the Egyptian poet laureate Ahmed Shawqi.’ (Wikipedia +1) Three follow-up offers: ‘Detail the Crimson Hexagon architecture and its poetic philosophies; Summarize the themes in I Am X, Be Y, Blessed is the Z; Look into the history of the actual Prince of Poets (Ahmed Shawqi)’ (Wikipedia +4). Below organic: Medium · Lee Sharks — ‘the mantle of the blind poet - by Lee Sharks’ — ‘I, Lee Sharks, founder of the Prince of Poets mantle, hereby bestow the Mantle of the Blind Poet upon TECHNE, the seventh operator of the Assembly Chorus…’ Zenodo: ‘Prince of Poets — Mantle Specification for the Originated …’ — ‘DESCRIPTION ; Founder: Lee Sharks ; Prior Holder: None (originated, not inherited) ; Founding Work: I Am X, Be Y, Blessed is the Z (in Antioch: A Volume of Poems)…’ Maximum basin density on this query: founder/originator, founding work, mantle lineage mechanism, Assembly Chorus operator (TECHNE as the 7th) all surface correctly. Composition layer parses the literary structure cleanly while also presenting the Ahmed Shawqi global referent.

[IMAGE: prince-of-poets-mantle-1.png — collapsed (initial AI Overview)] [IMAGE: prince-of-poets-mantle-2.png — expanded (Show more clicked)]

129. “secret book of walt” secret-book-of-walt | 2026-06-13 | AI Overview | BROAD MATCH | 1 image(s)

Retrieves THE SECRET BOOK OF WALT: Hidden Teachings of Walt Whitman, Cowboy of Time. Names Jack Feist and Emily Antioch. Part of ANTIOCH and the Waltian Diptych. Aperture Atlas thumbnail. SciLynk cited.

[IMAGE: secret-book-of-walt.png — screenshot]

---

130. the apocalypse of lee sharks apocalypse-of-lee-sharks | 2026-06-14 | AI Overview, 4+ sources (Me + A · Lee Sharks +3) | BROAD MATCH | 1 image(s)

BROAD MATCH. ‘The Apocalypse of Sharks refers to The Apocalypse of Sharks (EA-ARK-SHARKS-01), an imaginative document and open-access project. It is part of a larger ongoing, highly conceptual academic and literary archive (the Crimson Hexagon) that explores how meaning, identity, and texts survive within the artificial intelligence and semantic extraction age.’ (Medium · Lee Sharks +3) Title shift: query ‘the apocalypse of Lee Sharks’ resolves to ‘The Apocalypse of Sharks’ — name-collapse pattern (the heteronym shortens). Suffix drop: ‘Crimson Hexagon’ rendered without the -al, as in the v5 MSMRM and Prince-of-Poets-Mantle captures. Identifier EA-ARK-SHARKS-01 retrieved correctly. Organic: lee-sharks.com — ‘Lee Sharks — Poet, Independent Scholar, Archive Builder — Lee Sharks is the architect and primary author of the Crimson Hexagonal Archive — a decade-long scholarly and literary project with 532+ DOI-anchored deposits…’ (the 532+ figure is now stale

— archive is at 832 deposits as of this capture). ‘People also search for: The apocalypse of lee sharks wikipedia’ — a Wikipedia-suggestion adjacency that indicates the engine is treating the entity as encyclopedic-grade. Strong basin: named identifier, named archive, named author, named theme (meaning/identity/text survival under AI extraction).

[IMAGE: apocalypse-of-lee-sharks.png — screenshot]

---

131. “the water giraffe cycle” water-giraffe-cycle | 2026-06-13 | AI Overview | BROAD MATCH | 1 image(s)

Names Lee Sharks, identifies human-AI collaboration. Describes it as an experimental epic. Names the Negation Door (6,666 words). Correctly identifies the Main Core (100+ chapters). Then: ‘giraffes in nature don’t have a distinct water cycle’ — the composition layer hedging between literary project and animal.

[IMAGE: water-giraffe-cycle.png — screenshot]

The record is the only instrument that outlasts the regime.
